

## Instructions for Inserting Wired Wax Foundation

1. Snap out the wedge from the top bar.

- Some people snap all their wedges out before assembling frames and save them for step #5.

4. The hooks should nest in the gap you created in step #2.

- This way the wax will hang from the top bar.

2. Scrape out any strips of wood that remain in the space you've created.

5. Drive a few (1/2"-5/8") staples through the wedge from step #1 into the top bar.

3. Insert the bottom of the foundation wax (the edge without a hook on the wires) through the gap in the bottom bar.

- Sometimes you'll need your hive tool to spread out the gap.

6. Insert a bobby pin through each hole in the side bar so it straddles the foundation wax on either side.

- Press the side of the frame against a flat surface to push the bobby pins so they are nearly flush with the side.

Most of all, have fun with it!
