

Materials - *Bottom Cover*

Information Provided By Kevin Orthopedic Institute

Suede

Durable brushed bottom covering

FEATURES:

- Protects soft components of orthotic
- Durable
- Water resistant
- Thin
- Non-animal product

CLINICAL INDICATIONS:

- Sedentary to active patients

Suede is an extremely thin, synthetic bottom cover material that sits on the inferior surface of the orthotic and extends to a desired length: sulcus or toes. The synthetic nature of this material mimics natural suede's thinness, flexibility and attractive appearance but also adds durability, stain protection, odor resistance, and is more water resistant than natural materials. It is the most common bottom cover selection on Kevin Orthopedic products because of its minimal bulk and high durability. It protects modifications, pads and other coverings. As a bottom covering, suede covers any forefoot modifications or additional materials requested.
