Raise Medial Arch

Raise medial longitudinal arch

**FUNCTION:**
- Increases medial orthotic frame height

**CLINICAL INDICATIONS:**
- Pronation correction
- Inadequate clinical foot impression

Raising the medial arch is when a frame’s medial longitudinal arch is elevated superiorly within the foot model.

**Note:** This procedure is done in the modeling process. A positive model will have material removed to achieve a new, higher medial arch height.

**CLINICAL PEARL**
When patients possess a flexible midfoot (excellent midfoot joint excursions), this is a fantastic method for increasing orthotic reaction forces on the medial longitudinal arch.

---

**Notes:** All illustrations and diagrams are of right foot. Colors on illustrations are for visual purposes and will vary on final product. ORF = Orthotic Reaction Force.
