The Hoselink Root Waterer & Soil Breaker is an environmentally friendly way to water large trees and shrubs, by delivering water directly to their roots underground, thereby reducing water evaporation. It is also useful to break up hard soil, making the removal of weeds or plants much easier.

**Kit Contents**

1x Aluminium Tube  
1x Metal Trigger Handle with brass nut  
1x Hoselink Accessory Connector

**ASSEMBLY INSTRUCTIONS**

**Step 1.** Unscrew the fluted brass nut off the Metal Trigger Handle.

**Step 2.** Slide the end with O'Ring of the Aluminium Tube into the handle, until it stops at the O'Ring.

**Step 3.** Slide the brass nut over the pointed end of the Aluminium Pole and screw it onto the Metal Trigger Handle. This secures the pole to the handle.

**Step 4.** Attach a Hoselink-fitted garden hose to the Accessory Connector.

**STORAGE & MAINTENANCE**

We recommend storing the Root Waterer & Soil Breaker in the garage or shed when not in use. This will prolong the life of the product, protect it from the elements and prevent it from becoming a trip hazard in your garden.

The Metal Trigger Handle will need occasional lubrication with silicone oil or silicone spray to prevent the trigger plunger from sticking. With regular maintenance, this high quality metal product will provide you with years of reliable service.

12 Month Warranty

**USING THE ROOT WATERER**

Gently ease the end of the tube into the ground/soil and gradually depress trigger. Continue pushing the end of the tool into the ground. In addition to the large water outlet, there are small holes around the base of the Aluminium Pole to disperse water horizontally.

The tube will try to bury itself into the soil with little effort. If you meet hard resistance, such as a rock or tree root, stop immediately and try a different spot nearby.

Take care not to bend the Aluminium Tube or to force it into too hard ground too quickly, as this may cause it to break.

For very hard ground, commence water pressure near the surface and allow the soil to soften before slowly increasing depth.
