CBD FOR CRAMPS + PMS

WHAT IS CBD

"Cannabidiol," also known as CBD does not have psychoactive effects and offers tremendous therapeutic benefits. Many individuals shy away from using CBD because they believe it has the same effects as THC, but this is a common misconception and you will not get "high."

HOW DOES CBD WORK?

CBD is able to function in the human body because the human body comprises of CB1 and CB2 receptors which bind to cannabinoids. This system is referred to as the Endocannabinoid system. This network of receptors is responsible for immune function and pain perception and keep your body at a homeostasis state.

CBD is so effective that it neutralizes the effect of THC, the compound which makes cannabis users 'high'. THC causes anxiety, depression and stress for some while CBD does the opposite.

CBD FACTS

Hemp-derived CBD is legal in all 50 states. CBD must have less than 0.03% THC and produced by a state-licensed grower. With the 2018 Farm Bill that just passed, CBD derived from hemp is legal nationwide while marijuana-derived CBD differs state to state.

CBD is not psychoactive and will not result in the feelings of sedation, anxiety, elation, relaxation, hallucinations, and delusions, unlike THC.

CBD can reduce cramping and pain in the female reproductive tract (cervix, uterus, ovaries) during the menstrual cycle and also may help women afflicted with endometriosis
