

BENEFITS OF TREE TRAPPING – with the D-Rat

From many years of experience trapping in the bush we've found that the best results are achieved by Tree trapping. Using this targeted system, resident rodent populations can be brought to zero.

A NZ study showed that ship rats spend 80% of their lives up trees

It targets the ship rat in the place where it feels most secure and least wary.

Traps in trees directly protect our small birds (particularly when nesting), lizards and insects

Being raised also widens the lure scent throw so the draw in zone to the trap is greatly increased

The D-Rat for Tree Trapping

Highly accurate, humane strike

Safe and simple operation. Only a few seconds to clear and reset.

Interactive trapping so you can gain a real understanding of what's going on and when

Unique reset lever makes clearing and reset hands free, hygienic & easy – ideal for all levels of ability

Trap surfaces are easy to keep clean. Catch hangs down and clear when set vertically, so less smell & mess to deal with

Optimised for strength & sensitivity to guarantee you catch the full population – from the biggest rats to the smallest mice

Traps are light weight and come with different mounting options so they can be easily shifted to where they are most effective

Maintenance free. High quality engineering polymers and stainless steel ensure the traps perform at 100% their entire service life

Bright yellow cover makes traplines easy to follow, optimises the rodent's entry, keeps bait fresh and protects from wind and possums
