READ BEFORE USING: Safety

G2.0 Gloworm Lights are designed to be used in the harshest of conditions. However, their performance will vary depending on the exact situation and environmental influence. It is recommended that a spare light source is carried at all times to ultimately ensure your safety.

G2.0 Gloworm Lights are manufactured for specific activities and should be used only on completion of reading this User Guide.

As with any product designed to be used in the outdoors, Gloworm Lights present their own risks when in use:

>> Lights are designed to be moving when being used for extended periods. Failure to do so may result in the housing of the light becoming hot and light intensity decreasing.

>> Do not look directly into the light or shine the light directly at others. This could result in disorientation or eye damage.

>> When USB ports/connectors are connected the system is waterproof to IP67. However, it is advised that products are not submerged.

>> The USB Fast Charger is not designed for outdoor use. It should always be used indoors.

>> The light will emit a warning flash (5 flashes) when the Power Pack is at low capacity. Soon after the light will stop.

>> It is advised that the battery be disconnected from the light after use. The electronics will use a small amount of power and eventually discharge the battery OR the light may be switched on accidentally.

>> USB ports/connectors, when not connected, are sensitive to moisture. If ports/connectors are connected when wet, the light will protect itself by not operating. The port/connector will need to be dried in order for the light to operate.
