

Location:	Domestic Garden
Project:	Bamboo Barrier
Product:	FlexiRoot
Installer:	PBA Solutions

While Bamboo has many screening qualities it often spreads by sending out shallow roots that can spread several meters. These shallow roots technically known as rhizome but more aptly called runners due to their ability to rapidly spread can quickly get out of control.

Bamboo runners undermine lawns, including artificial lawns, grow into fence posts, spread to neighbouring gardens, and out compete other garden plants. All in all, it is important to block bamboo.

Our FlexiRoot barrier has a market leading puncture resistance of 5502 newtons, yet it is flexible making it easy to install when planting new Bamboo. Furthermore, you can retro fit Flexi root around established Bamboo removing runners that have already extended further than the location of the root barrier.

When using FlexiRoot Barrier to block Bamboo we suggest that our 600mm width material is used. This should be installed so there is a 50-100mm extension above ground. All joints must overlap and be sealed with a heavy-duty tape or heat welded.

Winners of the award for PCA Contractor of the Year 2019, PBA Solutions are industry leading experts who deliver Specialist Root Barrier Systems for Japanese knotweed, Bamboo, and other invasive plants.
