

01 Introduction

nank you for purchasing this HOBBYWING product! Please read this declaration carefullybefore use, once you use the product, we will assume that you have read and agreed with all the content.Brushless power system can be very dangerous and any improper use may cause personal injury and damage to the product and related devices, so please strictly follow the instruction during installation and use.Because we have no control over the use installation, or maintenance of this product, no liability may be assumed for any damages or losses resulting from the use of the product. We do not assume responsibility for any losses caused by unauthorized modifications to our product. We have the right to modify our product design, appearance, features and usage requirements without notification. We, HOBBYWING. are only responsible for our product cost and nothing else as result of using our product.Regarding the possible semantic different between two different versions of declaration, for users in mainland China, please take the Chinese version as standard; for users in other regions, please take the English version as standard.

HW-SMA540DUL00

02 Warnings

• To avoid short circuits, ensure that all wires and connections are well insulated before connecting the ESC to related devices

Xerun

USER MANUAL

KERUN XR10 Pro-WF

Ensure all devices in the system are connected correctly to prevent any damage to the system.
Read the manuals of all the items being used in the build.Ensure gearing,setup,and overall install is correct and reasonable.
Please use a soldering iron with the power of at least 60W to solder all input / output wires and connectors.

• Do not hold the vehicle in the air and rev it up to full throttle, as rubber tires can "expand" to extreme size or even crack to cause serious injury. • Stop usage if the casing of the ESC exceeds 90°C / 194°F as this may cause damage to both the ESC and motor. Hobbywing recommends setting the "ESC Thermal Protection" to 105°C / 221°F (this refers to the

ernal temperature of the ESC) The battery must be disconnected after use. There is a small draw even when the system is off, and will eventually fully drain the battery. This may cause damage to the ESC, and will NOT BE COVERED UNDER WARRANT

03 Features

9 select-to-use profiles applicable to all 1/10 RC car racing.

- Sequence of the application of performance, fearless of various weather conditions.
 Separate PRG/FAN port is able to power an external fan for maximize cooling performance or connect a LCD program box or OTA Programmer to the ESC.
 Variable frequency regulation of PWM & brake frequencies allows users to precisely regulate the driving & braking forces (of the motors).
- Softening function (HOBBYWING-initiated) for milder or wilder driving control and better driving efficiency. • Multiple protections: low-voltage cutoff protection, ESC and motor thermal protection, and fail safe (throttle signal loss protection), reverse polarity protection (the external standard cappack will still be damaged if battery reversal occurs).

 Data logging for recording the maximum ESC/motor temperature, motor RPM, and others in real time. • Firmware upgrade via Hobbywing multifunction LCD program box or OTA Programmer (item sold separately)

04 Specifications

	XERUN XR10 Pro-WP
Cont./Peak Current	160A/1200A
Motor Type	Sensored / Sensorless Brushless Motors
Applications	1/10 Touring&Buggy racing, 1/10 Drift,F1,Rally
Motor Limit	Touring Car: ≥4.5T Buggy: ≥5.5T
LiPo Cells	25 LiPo (Only 25)
BEC Output	5-7.4V Adjustable, Continuous Current of 5A (Switch-mode)
Cooling Fan	Powered by the stable BEC voltage of 5-7.4V
Size	37.7x37.2x19.6mm (w/o Fan)
Weight	95.6g (w/ wires)
Programming Port	PRG/FAN Port

Note: The recommended T counts are only applicable with the standard 3650/540 size (3 slot 2 pole) motors when ESCs are in blinky mode

05 Connections

This is an extremely powerful brushless motor system. For your safety and the safety of those around you, we strongly recommend removing the pinion gear attached to the motor before performing calibration and programming functions with this system. It is also advisable to keep the wheels in the air when you turn on the ESC.

Sensored motor connection MUST connect A from the ESC to A on the motor, B to B, and C to C, with the sensor wire connected any variation of the motor to ESC connections may cause damage Note: If the motor direction is reversed, change the parameter item "Motor Rotation" to achieve the correct setting.

2. Receiver Connetion The throttle control cable on the ESC has to be plugged into the throttle (TH) channel on the receiver. The throttle control cable has an output voltage of 5-7.4V to the receiver and steering servo, hence, no eparate battery can be connected to the receiver. Otherwise, your ESC may be damaged If additional power is required, disconnect the red wire on the throttle plug from the ESC 3. Battery Connetion

ty is essential. Please ensure positive (+) connects to positive (+), and negative (-) connects to negative (-) when plugging in the battery! When reverse polarity is applied to the ESC from the battery, the external standard cappack will be damaged

06 ESC Setup

ATTENTION

Set the Throttle Range - ESC Calibration Process

You must calibrate throttle range when you begin to use a new ESC, the transmitter has been replaced, or the Throttle TRIM have been adjusted, otherwise the ESC cannot work correctly. We strongly ecommend users to use the "Fail Safe" function on the radio system and set (F/S) to "Output OFF" or "Neutral Position". The throttle calibration steps are below:

• Leave transmitter at the neutral position, press the "ON/OFF" button, the GREEN LED flashes 1 time and the motor beeps 1 time to accept the neutral position

- It also called as minimum throttle force. You can set it according to wheel tire and traction. If the ground is slippery, please set a small throttle force. Some motors have strong cogging effect with lower FDR, if there is any cogging with very light throttle input, you can try to increase the initial throttle force.
- 2E. Coast This function allows the motor to naturally and smoothly reduce rpm/speed, and the vehicle will not experience sudden deceleration during the throttle release process. The higher the value, the stronger the "coasting"
- What is COAST? rings better and smoother control feeling to racers. Some drivers will refer to this to the traditional brushed motors Note: The Coast setting will not work if the drag brake is not set to 0%.
- 2F. PWM Drive Frequency
- The acceleration will be more aggressive at the initial stage when the drive frequency is low; a higher drive frequency is smoother but this will create more heat to the ESC. If set this item to "Customized", then the PWM frequency can be adjusted to a variable value at any 0-100% throttle input, Please choose the frequencies as per the actual test results of your vehicles. 2G. Softening Value
- It allows users to fine-tune the bottom end, change the driving feel, and maximize the driving efficiency at different track conditions. The higher the "Softening Value", the softer the bottom end. In Modified class, drivers often feel the power of the bottom end is too aggressive. Little throttle input usually brings too much power to the car and make it hard to control at the corners, this is HOBBYWING's solution to help om end traction. Note: You can increase the motor mechanical timing accordingly after you set the softening value. Every time you increase the softening value by 5 degrees, you can increase the mechanical timing by 1 degree.
- For example, if you set the softening value to 20 degrees, then you can increase the mechanical timing by 4 degrees. Please note that you will never increase the mechanical timing by over 5 degree
- 3A. Drag Brake It is the braking power produced when releasing from full speed to neutral position. This is to simulate the slight braking effect of a neutral brushed motor while coasting. It's not recommended for buggy and
- 3B. Drag Brake Rate
- This parameters is used to control the speed of the drag-brake response. Setting a suitable value can improve the drag braking effect of the vehicle, thus, improving drivability to suit each users. The value can be adjusted up to 20 levels. Increasing the value will result in a greater drag brake effect. The other "Auto" option is available as well to choose from. "Auto" will intelligently adjust the drag brake acceleration according to the current speed. The faster the current speed, the smaller the drag brake rate, vice versa. 3C. Max. Brake Force
- SHENZHEN HOBBYWING TECHNOLOGY Co., LTD. 101-402 Building 4, Yasen Chuangxin Hi-tech Industrial Park, 8 Chengxin Road, Baolong Industrial Town, Longgang District, Shenzhen, China,

Leave transmitter at the neutral position, press the "ON/OFF" button, the GREEN LED blanks 1 time and the motor beeps 1 time to accept the neutral position.
 Pull the throttle trigger to the full throttle position, press the "ON/OFF" button, the GREEN LED blanks 2 times and the motor beeps 2 times to accept the full throttle endpoint.
 Push the throttle trigger to the full brack position, press the "ON/OFF" button, the GREEN LED blanks 2 times and the motor beeps 3 times to accept the full brack endpoint.
 The motor can be started 3 seconds after the ESC/Radio calibration is complete.

Short press the power button to turn on the ESC in the off state, and long press the power button to turn off the ESC.
Attention I To prevent accidental shutdown in racing pressing the payor hutton cannot shut down the accushile the pastar is your

Note: Item 4C (Boost Start RPM) & item 4D (Boost End RPM) are not programmable if item 4B (Timing Activation) is set to "Auto".

1A. Running Mode

Option 1: Forward with Brake Racing mode. It has only forward and brake functions

Option 2: Forward/ Reverse with Brake

This option is known to be the "training" mode with "Forward/ Reverse with Brake" functions. The vehicle only brakes on the first time you push the throttle trigger to the reverse/brake position. If the motor stops when the throttle trigger return to the neutral position and then re-push the trigger to reverse position, the vehicle will reverse, if the motor does not completely stop, then your vehicle won't reverse but still brake, you need to return the throttle trigger to the neutral position and push it to reverse again. This method is for preventing vehicle from being accidentally reversed Option 3: Forward and Reverse

- motor will reverse immediately when the throttle trigger is pushed to reverse position. This mode is generally used in special vehicles. 1B. Max. Reverse Force
- The reverse force of the value will determine its speed. For the safety of your vehicle, we recommend using a low amount
- 1C. Cutoff Voltage Sets the voltage at which the ESC lowers or removes power to the motor in order to either keep the battery at a safe minimum voltage (for LiPo batteries). The ESC monitors the battery voltage all the time, it will immediately reduce the power to 50% (in 2 seconds) and cut off the output 40 seconds later when the voltage goes below the cutoff threshold. The RED LED will flash a short, single flash that repeats (\pm, \pm, \pm) to indicate the low-voltage cutoff protection is activated. Please set the "Cutoff Voltage" to "Disabled" or customize this item if you are using NiMH batteries.
- Option 1: Disabled The ESC does not cut the power off due to low voltage. We do not recommend using this option when you use any LiPo battery as you will irreversibly damage the product. You need to select this option when you are using a NiMH pack.
- Option 2: Auto The ESC calculates the corresponding cutoff voltage for the battery shall be 7.0V.
- **Option 3: Customized**
- ized cutoff threshold is a voltage for the whole battery pack (adjustable from 3.0V to 7.4V).

- 1E. Motor Thermal Protection
- 1F. BEC Voltage
- This esc has a fan control function. If this item is set to "Disabled", the fan will continue to run after the ESC is powered on; If this item is set to "Enabled", The fan will start running after the internal temperature of the esc exceeds 50 C/122°F

- Users can simply push and hold the brake trigger for 6 seconds. This option allows the user to turn off the ESC without pushing the ON/OFF button switch. Option 2: Disabled
- With the motor shaft faces you (the rear end of the motor is away from you), increase the throttle input, the motor (shaft) will rotate in the CCW/CW direction if the "Motor Rotation / Direction" set to "CCW/CW" Generally, the vehicle runs forward when the motor (shaft) rotates in the CCW direction. However, some vehicles only run forward when the motor rotates in the CW direction due to the different chassis design. In that case, you only need to set the "Motor Rotation/Direction" to "CW).
- 1J. Phase-AC Swap If the A/C wire of ESC connect to A/C wire of motor with crossed way (A wire of ESC connects to C wire of motor, C wire of ESC connects to A wire), set this item as Enable
- Warning! When #A/#B/#C wire of ESC connect to #A/#B/#C wire of motor correspondingly, do not Set to Enable. Otherwise it will damage the ESC and motor. 2A. Throttle Rate Control
- This item is used to control the throttle response. The higher the throttle rate, the more aggressive the throttle will be applied. A suitable rate can help driver to contr the vehicle properly during the starting-up process. Generally, you can set it to a high value to have a quick throttle response if you are proficient at throttle control.
- This parameter is used to set the throttle curve. The larger the curvature setting, the more aggressive the throttle will be applied in the previous stage; the smaller the curvature setting the softer the throttle will be applied in the previous stage. As shown in the schematic diagram of the curve on the right.
- tters have the same stability at "neutral position", please adjust this parameter as per your preference. You can adjust to a bigger value when this happens

- Softening Range It's the range to which "Softening Value" starts and ends. If set to 30% then the softening range will be from 0 throttle to 30% throttle
- (Attention! Drag brake will consume more power and heat will be increased, use it cautiously.)

D. ESC Thermal Protection The output from the ESC will be cut off with the value you have preset. The GREEN LED flashes ($\dot{\gamma}, \dot{\gamma}, \dot{\gamma}$) when the ESC temperature reaches to the preset value. The output will not resume until the ESC temperature gets dow Warning! Please do not disable this function unless you're in a competition. Otherwise the high temperature may damage your ESC and even your motor

- The GREEN LED flashes (法会, 会会, 会会) when the motor temperature reaches to the preset value. The output will not resume until the motor temperature gets dow Warning! Please do not disable this function unless you're in a competition. Otherwise the high temperature may damage your motor and even your ESC. For non-Hobbywing motor, the ESC may get this protection activated too early/late because of the different temperature sensor inside the motor. In this case, please disable this function and monitor the motor temperature manually.
- BEC voltage can be adjusted between 5.0-7.4V.Set a reasonable value according to the working voltage of the servo.
- 1G. Smart Fan:
- 1H. Remote Off Option 1: Enabled

- ers must turn off the ESC by pressing the ON/OFF switch button from the ESC.
- 11. Motor Rotation/Dir

dental shutdown in racing, pressing the power button cannot shut down the esc while the motor is running, if there is an emergency, battery plugs can be pulled out to turn off the ESC

Throttle

will shorten the braking time but it may damage your pinion and spur. 3D. Brake Rate Control This ESC provides proportional braking function; the braking effect is decided by the position of the throttle trigger. It sets the percentage of available braking power when full brake is applied. Large amount

It's adjustable from 1 to 20 (step: 1), The larger the setting value, the greater the brake rate, that is, the faster the braking. A suitable rate can aid the driver to brake his vehicle correctly. Generally, you can set it to a high value to have a quick brake respo

3E. Brake Frequency The brake force will be larger if the frequency is low; you will get a smoother brake force when the value is higher. If set this item to "Customized", then the brake frequency can be adjusted to a variable value at any 0-100% throttle input. Please choose the frequencies as per the actual test results of your vehicles

3F. Brake Control Option 1: Linear

Hobbywing has recommended using this mode under all circumstances. The braking effect is a bit weaker in this mode than in Traditional brake mode, but it's easy to control and brings great control feel Option 2: Traditional

onal brake method, just like the previous escs, the brake force is stronger Option 3: Hybrid

The ESC switches the brake mode between Linear and Traditional as per the vehicle speed to prevent the slide (between tires and track) from affecting the braking effect

Note: Please select the right mode for your vehicle as per the track condition, motor performance, and etc

4A. Boost Timing It is effective within the whole throttle range; it directly affects the car speed on straightaway and turns. The ESC adjusts the timing dynamically as per the RPM (when "Boost Timing Activation" set to "RPM") or throttle amount (when "Boost Timing Activation" set to "Auto") in the operation. The Boost Timing is not constant but variable

4B. Boost Timing Activation Option 1: RPM

In RPM mode, the ESC adjusts the Boost Timing dynamically as per the motor speed (RPM). The actual Boost Timing is 0 when the RPM is lower than the Boost Start RPM. The Boost Timing changes as per the RPM when the RPM change is between the Boost Start RPM and the Boost End RPM. For example, if the Boost Timing is set to 5 degrees and the Boost Start RPM is 10000, the Boost End RPM is 15000. The Boost Timing corresponds to different RPM is shown below. When the RPM is higher than the Boost End RPM, the actual Boost Timing is the value you had previously set.

RPM (Motor Speed)	<10000	10001-11000	11001-12000	12001-13000	13001-14000	14001-15000	>15000
Actual Boost Timing	0 Degree	1 Degree	2 Degrees	3 Degrees	4 Degrees	5 Degrees	5 Degrees

Option 2: Auto

in Auto mode, the ESC adjusts the Boost Timing dynamically as per the throttle amount. Only at full throttle, the actual Boost Timing is the value you had previously set. 4C. Boost Start RPM

This item defines the RPM at which Boost Timing is activated. For example, when the Boost Start RPM is set to 5000, the ESC will activate the corresponding Boost Timing when the RPM goes above 5000. The specific value is determined by the Boost Timing and the Boost End RPM you had previously set. 4D. Boost End RPM

This item defines the RPM at which Boost Timing (you specifically set) is applied. For example, when Boost Timing is set to 10 degrees and the Boost End RPM to 15000, the ESC will activate the Boost Timing of 10 degrees when the RPM goes above 15000. The ESC will adjust the Boost Timing accordingly as per the actual RPM when the RPM goes below 15000. 5A. Turbo Timing This item is adjustable from 0 degrees to 64 degrees, the corresponding turbo timing (you set) will initiate at full throttle. It's usually activated on long straightaway and makes the motor unleash its maximum potential.

- 5B. Turbo Delay When "TURBO DELAY" is set to "INSTANT", the Turbo Timing will be activated right after the throttle trigger is moved to the full throttle position. When other value(s) is applied, you will need to hold the
- ottle trigger at the full throttle position (as you set) till the Turbo Timing initiates 5C. Turbo Increase Rate This item is used to define the "speed" at which Turbo Timing is released when the trigger condition is met. For example, "3 degs/0.1sec" refers to the Turbo Timing of 3 degrees that will be released in 0.1
- second. Both the acceleration and heat is higher when the "Turbo increase rate" is of a larger value. 5D. Turbo Decrease Rate After the Turbo Timing is activated and the trigger condition turns to not be met (i.e. vehicle slows down at the end of the straightaway and gets into a corner, full throttle turns to partial throttle, the trigger
- condition for Turbo Timing turns to be not met), if you disable all the Turbo Timing in a moment, an obvious slow-down like braking will be felt and cause the control of vehicle to become bad. If the ESC can disable the Turbo Timing at some "speed", the slow-down will be linear and the control will be improved. Warning! Boost Timing & Turbo Timing can effectively improve the motor efficiency; they are usually used in competitions. Please take some time to read this manual and then set these two items carefully, monitor the ESC & motor temperatures when you have a trial run and then adjust the Timing and FDR accordingly as aggressive Timings and FDR may cause your ESC or motor to be burnt.

Preset Modes

In order to make one firmware applicable to all different racing conditions, there are nine "easy-to-select" preset modes (as shown below). Users are able to change the settings of the modes provided (and rename those modes) as per the control feel, track, and etc. For example, the name can be changed from "Modify" to "TITI2019_MOD_4.5" to indicate the race was ran with a 4.5T motor at 2019 TITC. This can be saved for future reference as well.

Preset Modes for Different Racing:						
Mode #						
1	Zero Timing	All Stock racing requiring users to use Zero timing (/blinky) program on their ESCs.				
2	TC-Modify	Modify class of 1/10 touring car racing				
3	Buggy-2WD-Modify	Modify class of 1/10 2WD buggy racing				
4	Bubby-4WD-Modify	Modify class of 1/10 4WD buggy racing				
5	Practice	(With Reverse function activated,) practice and sport				
6	OpenBL-13.5T	13.5T Open Stock class of 1/10 touring car racing				
7	OpenBL-17.5T	17.5T Open Stock class of 1/10 touring car racing				
8	SCT-4 Pole	1/10 short course truck using 4 pole motor				
9	Drift 2WD Carpet	1/10 drift 2WD car on Carpet				

5 ESC Programming

- . Program your ESC with a multifunction LCD program box pro
- Connect the interface marked with "-++ at" on the esc to the interface marked with "ESC" on the program box using a separate programming cable(a cable with JR plugs at both ends included in the program pox packaging), then connect the esc to the battery and turn it on. Click on [Parameter Settings] to set the esc
- 2. Using the OTA Programmer for parameter settings Insert the programming cable of the OTA Programmer into the programming interface of the esc, and use your phone to install the HW Link APP to set the esc. 3. Read the running data of esc
- 1) Click on the [Data record] on the homepage of the LCD box pro to read the five extreme values of the highest temperature of the esc, the highest temperature of the motor, the maximum current, the lowest voltage of the battery, and the highest rpm of the motor during the operation of the esc.
 2) By using the OTA Bluetooth module, you can view the five extreme values recorded above, real-time data, and historical data (curve chart) under the [Data Log] menu in the HW LINK App on your phone.
- 4. Upgrade of firmware for esc
- Using the LCD box pro or OTA programmer, download and install the HW LINK App on your phone, click on the [Firmware Update] button on the APP homepage to upgrade the firmware of the esc.
- 2) Connect to the computer through the LCD box pro, download and install Hobbywing USB LINK software on the computer, and use this software to upgrade the firmware for esc

6 Factory Reset

- Restore the default values with a multifunction LCD program box pro After connecting the program box to the ESC, Click on [Parameter Settings] and select the [Reset Parameters] to restore the factory settings. • Restore the default values with a OTA Programmer (& HW Link App)
- After connecting the OTA Programmer to the ESC, open the HOBBYWING HW Link App on your smart phone, select "Parameters" followed by "Factory Reset" to reset the ESC

07 Explanation for LED Status

- 1. During the Start-up Process
- The RED LED turns on solid indicating the ESC doesn't detect any throttle signal or the throttle trigger is at the neutral position
- The GREEN LED flashes rapidly indicating the neutral throttle value stored on your ESC may be different from the current value stored on the transmitter. When this happens, re-calibrate the throttle range. The RED LED turns on solid and the GREEN LED dies out when the throttle trigger is in the throttle neutral zone. The RED LED will blink meet the Zero Timing competition rules, if the total value of Boost
- Timing and Turbo timing is 0. • The RED LED dies out and the GREEN LED blinks when your vehicle runs forward. The GREEN LED turns solid when pulling the throttle trigger to the full (100%) throttle endpo
- The RED LED dies out and the GREEN LED blinks when you brake your vehicle. The GREEN LED turns solid when pushing the throttle trigger to the full brake endpoint and setting the "maximum brake force" to 100%
- The RED LED dies out, the GREEN LED blinks when you reverse your vehicle. The GREEN LED turns solid when pushing the throttle trigger to the full brake endpoint and setting the "reverse force" to 100%. • The RED LED flashes a short, single flash and repeats " \dot{x} , \dot{x} , \dot{x} " indicating the low voltage cutoff protection is activated
- The GREEN LED flashes a short, single flash and repeats "
 ^{*}
 • The GREEN LED flashes a short, double flash and repeats "合介, 合介, 合介, 合介, indicating the motor thermal protection is activated.
- The RED & GREEN LED fish a short, single flash and repeats '\overlag', \overlag', \overlag' and the same time indicating the motor thermal protection is activated.
 The RED & GREEN LED fish a short, single flash and repeats '\overlag', \overlag', \overlag' at the same time indicating the drive mode has been automatically switched to sensorless mode from senored mode because of abnormal sensor signal when pairing the ESC with a sensored motor.

08 Trouble Shooting

Trouble	Possible Causes	
The ESC was unable to start the status LED, the motor, after it was powered on.	 No power was supplied to the ESC; The ESC switch was damaged. 	Check if all ESC & battery connectors have been well soldered or firmly connected.
After power on, the RED LED flashes and the motor does not work.	The throttle cable of the esc is connected incorrectly or the throttle is not at the neutral position.	 Plug the throttle cable into the throttle channel (CH2) by referring to relevant mark shown on your receiver. Calibrate the esc and radio.
The vehicle is going in the reversed direction when the forward throttle is applied.	The default/popular motor rotation direction does not match your car frame.	Adjust the parameter "Motor Rotation".
The motor suddenly stopped or significantly reduced the output in operation.	 The receiver was influenced by some foreign interference; The ESC entered the LVC protection; The ESC entered the thermal shutdown protection. 	 Check all devices and try to find out all possible causes, and check the transmitter's battery voltage; The RED LED keeps flashing indicating the LVC protection is activated, please replace your pack; The GREEN LED keeps flashing indicating the thermal protection is activated, please lety your ESC cool down before using it again.
The motor stuttered but couldn't start.	 The (ESC-to-motor) wiring order was incorrect Some soldering between the motor and the ESC was not good; The ESC was damaged (some MOSFETS were burnt). 	 Check the wiring order; Check all soldering points, please re-solder if necessary; Contact the distributor for repair or other customer service.
The vehicle could run forward (and brake), but could not reverse.	 The throttle neutral position on your transmitter was actually in the braking zone; Set the "Running Mode" improperly; The ESC was damaged. 	 Recalibrate the throttle neutral position; Set the "Running Mode" to "Fwd/Rev with Brk "; Contact the distributor for repair or other customer service.
The motor got stuck or stopped when increasing the throttle during the starting-up process.	 Poor discharging capability of the pack; The RPM of the motor was too high, or the FDR was too low; The Throttle Rate Control is set too high. 	 Change another pack with great discharging capability; Change a low-speed motor, or increase the FDR; Set the Throttle Rate Control to a low level.
The RED & GREEN LEDS on the ESC flashed rapidly at the same time when the throttle trigger was at the neutral position.	(When pairing with a sensored motor) the ESC automatically switched to sensorless mode when it detected incorrect signal from Hall sensor.	 Check if the sensor cable is loose or poor contact issue exists; Hall sensor inside the motor or the ESC is damaged.
