1 The choice is yours

Each spray can model includes the cap that best suits its paint type and use. However, it may be exchanged for the one that best suits your tastes or needs.

2 Shake it!

Inside the spray can there is a mixture of solvent and paint, as well as gas. These materials have different densities that tend to separate while not in use, so, in order to use them correctly they must be as mixed as possible.

3 Purge the cap!

A cap with residual paint in its interior will deteriorate its performance or cause it to become clogged. To avoid this from occurring, we recommended purging each spray can in an inverted position after use in order to release the gas without paint, thus cleaning the cap duct.

4 Painting with clean lines...

With Skinny Caps you can paint thin, clean lines by bringing the spray can closer to the wall. Whether or not the paint drips will depend on your speed and expertise.

5 Caps for all tastes

The basic shape released from the can with a quick press of the cap is a dot; a shape that serves as an effective decorative element. With the various caps you can achieve all kinds of dots: from thin, compact ones, to thick, hollow ones.

6 Fades and other special effects...

The amount of paint that the spray can projects on a surface depends on its position with respect to the surface. Try experimenting by spraying from different angles in order to create fades and changes in line width.

When clogging is irreparable...

Even though you follow all of our step-by-step advice, caps tend to get clogged due to the paint drying quickly and the technical precision of its performance. For these cases there are two alternatives: replace it with a new one or clean it thoroughly with MTN PRO Solvent.

ALL IS NOT LOST!
