

STRIKEHOLD FIELD TEST

Agriculture & Irrigation Equipment

When it comes to keeping farm equipment running smoothly, it takes detailed maintenance and the proper repairs to avoid expensive breakdowns. Rust is a never-ending battle. Water gets into everything, even the most robust components and equipment. Almost 50% of all electric, electronic and mechanical component failures are caused by rust and corrosion.

The most common reason for corrosion-related failure is atmospheric humidity, condensation and environmental contaminations (dust, dirt, salt, nitrogen, etc.) Extend service life. Improve operating efficiency. Reduce downtime, service and repair costs. Save on replacement part costs. StrikeHold prevents rust and corrosion in the most extreme conditions, preventing premature failure of agriculture and irrigation equipment.

StrikeHold dielectric to 40,000 volts anti-rust spray can waterproof electronics, circuit boards, lighting, electrical, wire, connectors, switches, motors, etc. It can be used to prevent rust and corrosion on all agriculture tractor and tillage equipment, planting equipment, harvester and harvest equipment, irrigation, and other agriculture equipment and vehicles.
