
STAGE 1 - BEGINNER

Adult and Child handle in tandem.

This gives the adult full control over speed and direction of the board whilst allowing the child to hold on for stability.

It's extremely important in this phase that there is 100% direct contact adult supervision. Children should not be left alone with the board at any stage and should always be wearing full safety equipment.

STAGE 2 - INTERMEDIATE

Adult handle only.

This phase still gives the adult full control over speed but allows the child to focus on balance. This stage should also introduce the child to controlling the board left and right as well as stopping on their own.

Again, 100% direct contact adult supervision and full safety equipment is important during this phase.

STAGE 3 - ADVANCED

Lose both handles.

(Remove the Adult handle joint and replace the Phillips head screws to the board to cover the holes).

Your child is now confident on the board without intensive adult supervision, they are able to manoeuvre left and right and come to a stop on their own.

It is recommended at this phase that adults are still in full supervision (but not direct contact) and that the child is still wearing full safety equipment.
