Assembly recommendations

The clamp "ear" is deformed with a constant tool jaw force – this practice is referred to as "force priority closure". This assembly method ensures that a uniform and repeatable stress is applied to the joint in addition to a consistent tensile force on the clamp interlock. Employing this methodology when closing a 167 series clamp will compensate for any component tolerance variations, and ensure that the clamp applies a constant radial force to the application. Fluctuations in component tolerances are absorbed by variations in the "ear" gap(s). Clamp installation monitoring and process data collection are available by incorporating an "Electronically Controlled Pneumatic Power Tool" Oetiker ELK in the assembly process.

Important

- The ear height is naturally given. Do not influence the ear height, either by changing the ear gap or with built-in hold-down devices in installation tools.
- Single tool stroke closure only, do not apply secondary crimping force.

FEATURES

- Corrosion resistance according to DIN EN ISO 9227
- Narrow band: concentrates transmission of clamping force, less weight
- Stepless over 360°: uniform compression or uniform surface pressure
- Clamp ear: compensates for component tolerances, adjustable surface pressure
- Dimple: increases clamping force, spring-effect compensates for changes in diameter due to thermal expansion
- Burr-free strip edges: reduced risk of damage to parts being clamped

'P' CLIPS

DESCRIPTION

Their rubber lining allows for firm and safe clamping in the application zone and prevents potential damage due to vibration. The steel reinforced screw holes at either end ensure they clamp down firmly. P-clips are particularly recommended for mounting pipes, electric cable ducting and hoses in a multitude of different applications. Manufactured entirely from AISI-304 material, it is ideal for marine applications.

GLYCERINE FILLED STAINLESS STEEL PRESSURE GAUGES – DUAL SCALE

DESCRIPTION

For the measurement of fluid liquids that are not: highly viscous, high temperature (over 60°C), likely to solidify/crystallise or corrosive to copper or tin alloys.
Also suitable for gases (except oxidising gases such as oxygen or acetylene) up to 25 bar maximum. Glycerine filled gauges are particularly suited to applications where oscillating/surging pressures or vibration are present. The damping effect of the glycerine will steady the pointer making it easier to take a reading against the scale.
