

General Pre-Construction Bracket Install Guide

Bracket style/type may vary from picture above, but installation method is the same for all brackets. Some brackets may need to be assembled, connecting the mounting flanges to the circle portion in the appropriate positions. The circle portion has a lip that protrudes, this lip should face out toward the drywall side.

Secure bracket arms to framing in desired position using the supplied screws or your own, making sure you have plenty of clearance above and around the brackets opening for the full depth of the SpkrShell enclosure and wiring. Refer to compatible SpkrShell documentation for proper sizing and clearance.

Ensure the electrical tail is long enough to reach through bracket opening to make wiring the SpkrShell enclosure easy at install time.
