

Universal Drop Ceiling Support Install Guide

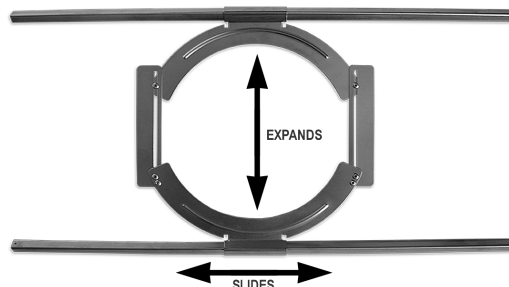

Follow your speaker or enclosures install instructions as normal... cutting your hole in the drop tile as directed.

Then place this support ring on the back of the tile so it is sitting flat against the tile and around your hole, adjust the support ring diameter to that of your hole.

Now set the rings support bars against/over the grid wherever possible, you may need to cut the support bars for fit depending on the style of drop tile supports you have. We want the support ring and bars to take the bulk of the weight of your product by dispersing it to the drop grid.

Next Insert your speaker/enclosure through the hole and support ring, finish installing as normal.

Clamp the speaker or enclosure feet as instructed, making sure they land on the support ring. The weight will now be evenly spread out over the tile to the grid of the drop ceiling.

*If your grid is oddly shaped, or you have no grid nearby, insert grid support wires (not included) through the holes provided in the support ring and the end of the rails. Run grid wire from each hole to a nearby structure above, this will take the weight of your speaker or enclosure instead.
