

Natural Finish

Our Natural Finishes are amongst the most popular of our finishes range.

Over time, copper and brass that is left untreated will develop a natural layer of tarnish, darkening in colour to a variety of rustic tones. This layer brings both anti-microbial and corrosion resistant properties, making it a perfect choice for both indoor and outdoor use.

Available in copper or brass.

Natural copper —————▶ *Natural tarnish over time*

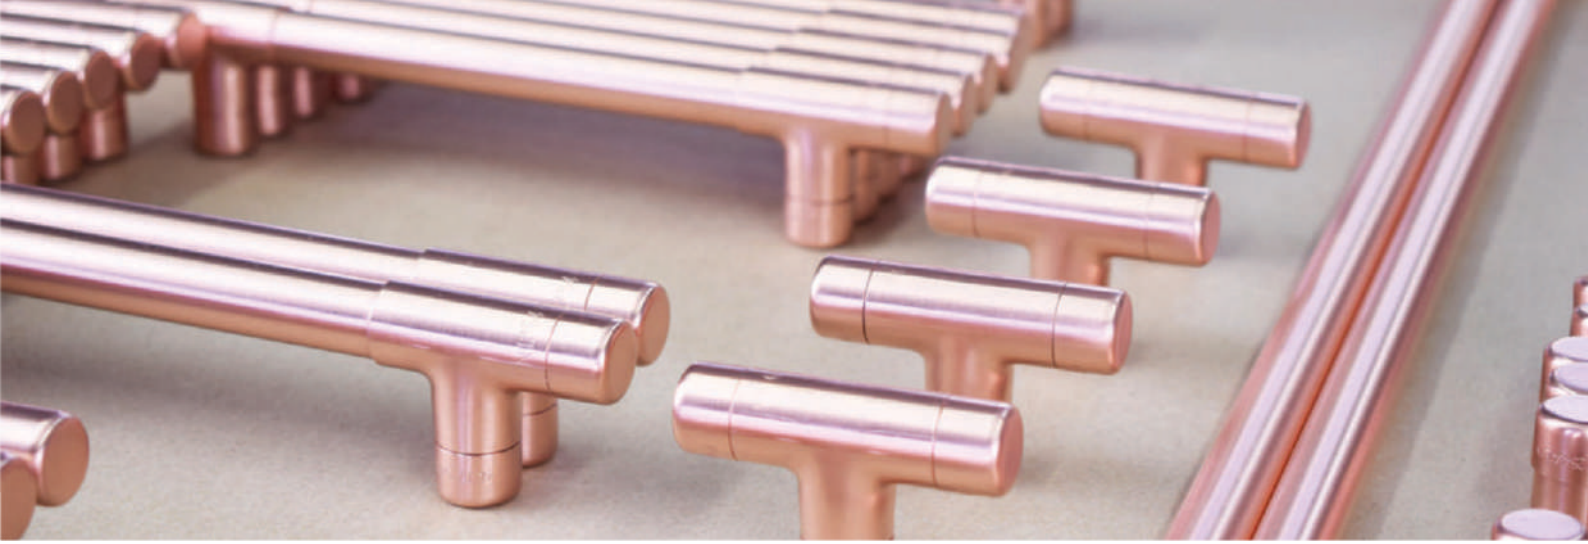

Natural polished brass —————▶ *Natural tarnish over time*

One of the brilliant properties of copper and brass is their ability to prevent the growth and proliferation of harmful germs, bacteria and viruses that are spread with the human touch.

Natural copper and brass when left unlacquered is a self cleaning metal, which is why we think that it is the ideal choice for our range of handles, showers and taps.

Finishing Process

Every item is taken through a number of different polishing stages in order to achieve our natural finish.

Once a product has been crafted, it is first rough sanded back to a raw state, then gradually polished up to a smooth and shiny satin finish.

Over time this finish will tarnish, darkening in colour to a variety of rustic tones - the darker the colour the greater the antimicrobial properties.

Care & Protection

Natural items are left without a protective coating. This allows the copper or brass to build up a layer of tarnish over time. This layer of tarnish not only creates a decorative and often appealing patina, but is also anti-microbial and prevents further corrosion from taking place.

Natural items can however be easily restored to their previous shine by polishing with a metal cleaning product such as 'Brasso'. These products can easily be purchased Online or at your local hardware store.
