

The Radfan is a low power radiator fan, which fits neatly onto almost any radiator and attaches securely with magnets. It uses quiet fans to redirect heat from the radiator into the heart of the room. With the use of a thermostatic switch it turns on and off with the radiator and costs just £2 a year to run.

Not only does the Radfan have hundreds of raving five-star reviews on Amazon, it has also been scientifically proven to increase the room temperature at sofa height.

Recently launched in Lakeland stores nationwide as well as sold online through Amazon, the popularity of the product continues to grow and has been met with high praise from happy customers and the general consensus of “why has no one thought of this before, it’s so simple”.
