

Keep your Wheels Tight

Good

Bad

Note: When attaching the wheels to your Equicizer, it is important that the wheels be screwed in as tight as possible to the Equicizer frame. Not doing so can cause the threaded stem of the wheel to bend or break when riding or moving from place to place. You may also need to check your wheels periodically in case they should loosen over time.

Instructions: To attach and tighten caster wheels, using your hands, place the caster wheel in the locked position by pushing the pedal of the wheel down. Then place the threaded stem of the wheel into the Equicizer frame and turn clockwise (right) until tight.
