

Topilase[®]

Application protocol

- Squeeze the upper compartment to release the enzymes into the solution
- Shake the bottle vigorously
- Once emptied, discard the upper compartment and screw the dosing tip to the lower compartment
- Shake the bottle again
- Apply a few drops of Topilase[®] to the area to be handled and spread the product using the brush or your gloved hands
- Massage the area well for 1 to 2 minutes
- Remove excess product

Additional care protocol

- Topilase[®] can be applied as part of a routine with a Skin Roller and an infrared LED for a few minutes for a synergistic effect

Care spacing

The number of sessions depends on:

- the desired result
- the type of hyaluronic acid injected
- the date on which the area was injected
- the plane in which the area was injected

The less reticulated is the hyaluronic acid, the more Topilase[®] attenuates the irregularities associated with its presence.

- Each Topilase[®] treatment should be spaced one week apart
- On average 3 sessions will be necessary
1st session on D-0 / 2nd session on D-7 / 3rd session on D-14

Conservation

- Maximum 14 days in the refrigerator once opened
