

DXT Mouse

Wired and Wireless

Promotes ergonomic relaxed wrist and hand position

The design of the DXT Mouse enables the hand to work from a vertical relaxed position reducing tension and twisting of the forearm.

Using the hand as it was designed

The DXT Mouse's small, vertical, pen-like design results in a balanced distribution of work throughout the fingers, hand, wrist, forearm, and shoulder.

This not only promotes long-term health and comfort, but also enhances precision by harnessing the largest section of the motor cortex – the section controlling the thumb and fingers.

Universal design provides accuracy and productivity

The DXT Mouse has been designed to work with most hands. The unique design fits all hand sizes, is ambidextrous and allows for natural movements of the hand and arm ensuring precise cursor movements.

Adopting the precision grip, where the index finger and thumb work closely together allows efficient and accurate cursor control.
