

## **BLOOM**

### **Directions for use**

Per 10 litres of water – 2,5ml in weeks 1 and 2 of growth cycle thereafter 7ml, 20ml in weeks 3 – 6 of bloom cycle.

Use in conjunction with EHG Micro and Grow. Using EHG products as directed will provide a balanced nutrient profile for every stage of your plant's growth

- Store in a cool dry place
- Shake well before use
- Do not mix formulas. Add each component one at a time to the same reservoir of water
- Balance the PH of the water in the reservoir after adding formulas and before feeding

The nutrient strength suggested in the chart is a general guide. For some heavy feeding plants the recommended ratios can be as much as doubled (to a maximum EC reading of around 2.2 - 2.4) with good results. Any increases must be made with caution, only by experienced growers and **according to your particular plants' requirements**. Particular care is required in aeroponic, nutrient film and deep water culture systems where the plants' roots are constantly exposed to the nutrient solution.
