Seeds for Africa

Bulbine

This is an easy to grow, water-wise, floriferous groundcover, which with the minimum of care, will look good all year round. It combines beautifully with blue dwarf agapanthus, flowering at the same time.

This succulent perennial multiplies rapidly. Prune it when untidy. For best results it should be planted in well-drained soil preferably enriched with compost. The dead flower heads should be removed to encourage further flowering. These plants prefer full sun, but they will also grow in semi-shade for part of the day. Although it will grow indoors, it requires maximum light.

Propagation is from seed, cuttings or either division of clumps, and should be done in spring. Once the seedlings have four leaves and the cuttings have a well-formed root system, they can be transplanted.
