Myrothamnus Flabellifolius

Resurrection plants—or plants that are poikilohydric, in biology-speak—are found growing in seasonally arid sites all over the world.

Myrothamnus seeds are tiny, so plant in a pot of loose peat moss and perlite mix, right on the surface. The plants come primarily from summer-rainfall areas, so spring is probably the best time of year to get them started. Germination is easy and quick in a seed pot kept in a moist, well-lit location.

Seedlings should be kept moist, in a sunny spot with good air circulation. Initial growth is slow, but as is the case with many plants, growth accelerates as the seedlings gain some size, and in two or three years Myrothamnus can become respectably shrubby. The plants do best in full sun.
