

Ranunculus

Sow Ranunculus seeds in winter to spring.

Ranunculus flower about 3 - 4 months after being sown from flower seed.

The key to growing Ranunculus from flower seed is growing them in cool temperatures. Ranunculus flower seeds needs to germinate between 10-16 degrees celsius and then grow on at 16 degrees celsius days and 4 degrees Celsius nights.

Use sterile potting soil and trays. Sow Ranunculus seeds on the surface of the soil and gently press the flower seeds in. Keep the trays out of direct sunlight and always moist.

Transplant Ranunculus seedlings into larger pots when 4 - 5 true leaves appear. Ranunculus does better as a container plant. It will thrive in the cool of spring.

Ranunculus makes a great houseplant when it is grown in indirect light.

Ranunculus Flower Care: Whether grown in the ground or in containers, Ranunculus plants benefit from mulch which helps keep the roots cool. After blooming, when leaves begin to yellow, cut the plant down low to the soil.
