

DOG FOOD ACCEPTABILITY TEST FOR EARTH ANIMAL

Summary

PetMech, LLC, a humane pet product research and testing company located in Stillwater, Oklahoma, tested Wisdom Chicken and Turkey formulas animal feed made by Earth Animal, LLC, Westport, Connecticut. Test protocol assumed a single pet-food formula with two different flavors (chicken and turkey). The two different flavors were identical formulations, except for the animal-based protein source. The dog feed was tested for acceptability, feed efficiency, mass balance and stool quality. Tests were conducted in-home with a panel of owners and their pet dogs.

Important findings

Test Result

Test	Result
Acceptability of dog panel and owners	100%
Pet weight during the study	7% average gain
Mass efficiency	95%
Energy efficiency*	87% average
Energy efficiency (unadjusted)	97% average
Metabolizable Energy (ME)	18.4 kJ/g
Digestible Energy (DE)	20.1 kJ/g

*adjusted for losses in urine, using the constant of 5.23 kJ/g digestible protein consumed.

Methods

Pet selection

Eight dogs were selected for the digestibility study (see Table 1). Dogs were of mixed breeds, age, temperament and sex to approximate market conditions. Selected dogs owners were trained to feed, collect and examine feces from pets and record observations on forms. Pets

and owners were selected for the study with the specific goal of achieving test results (e.g. owners with multiple pets would not be selected, if it would have been impossible to determine amounts of product consumed by each pet).

Table 1. Description of pet dogs in the panel.

	Pet	Sex	Breed	Age	Initial Wt, lb
1	Bean	M	Terrier, Yorkie-poo	1	10.5
2	Bear	M	Shepherd Mix	1	71.5
3	Bryn	F	Collie, Border	2	40.0
4	Chub	M	Bulldog, English	5	57.0
5	Duke	F	Retriever, Labrador	1	89.0
6	Ellie	M	Golden Doodle	1	47.0
7	Lucy	F	Great Pyrenees Mix	6	94.5
8	Roman	M	Great Pyrenees Mix	6	111.0
			Avg	2.9	65.1

Objectives

Test objectives were:

- Determine assimilation:
 - Measure consumption (input) for each pet.
 - Measure feces production (output) for each pet.
- Calculate an energy balance and efficiency of feed use based on composition and input of feed and composition and output of feces.
- Provide a visual record of the condition of the pet's stool (photograph).
- Provide a record of the pet's interest in the product (owner survey)
- Survey pet owners to determine their opinion of the condition of the pet's stool, acceptability of the diet (transition issues), and of the product in general.
- Laboratory analysis of stool (total energy and moisture content)

Pet mass

Pets were weighed by the veterinarian on the same scale prior to the acclimation period and near the last day of the feed trial.

Feed assimilation

Four of the dogs were exclusively fed the turkey flavored product for 5 to 7 days, the remaining four pets were fed the chicken flavored product during the same period. There was an acclimation period of 5 days where the pets were fed their normal food with 25% (by weight) of the trial product for the first day, then 50% of the trial product for the second day, then 75% of the trial product for the third day, and 100% of the trial product for two days. At least one of the pets, Bean, bypassed the assimilation period because he refused to eat his old

food after tasting Wisdom.

Feeding

Owners were trained to feed their pets exclusively the test dog food, excluding all other foods, treats and table scraps from their diets during the full-test period. Owners also observed their pets' behavior. The feed was delivered in pre-weighed containers. Owners fed their pets as they had done previously to the test (as closely as possible) using their customary amount of feed, feed method, and timing. General guidelines given for pet food consumption were about 1/4 cups per kg body weight per day on average. Unused feed was collected and weighed to determine the net amount consumed during the test period.

Feces collection

Each pet owner and environment were pre-selected to facilitate feces collection. Owners collected their pet's feces on a daily basis prior to the acceptability testing and during the testing. Collection bags were provided and three of the daily collections were recovered and weighed. The average of the three collections was used to estimate the daily feces production for each pet. Collected samples were dried and analyzed for laboratory testing, including moisture and energy content.

Laboratory analysis

Samples of feed and feces were tested at PetMech for moisture and energy. Energy was tested using a Parr Bomb Calorimeter. Net energy of the feed consumed by each dog was calculated by subtraction. The energy of the feed input and feces output were calculated based on the dry matter weights, and the results of calorimeter analysis for all samples. A correction factor of 5.23 kJ/g of digestible protein was used to account for energy lost through urine.

Results

Pet weight

Pets were weighed immediately prior to commencing the feed assimilation period and on, or near the last day of the feeding period. Table 2 shows the results of the pet weight measurements during the study.

Table 2. Pet weight measurements and % change.

	Pet	Sex	Breed	Age	Initial Wt, lb	Final Wt, lb	% Diff.
1	Bean	M	Terrier, Yorkie-poo	1	10.5	10.2	-2.9
2	Bear	M	Shepherd Mix	1	71.5	81.6	14.1
3	Bryn	F	Collie, Border	2	40.0	42.0	5.0
4	Chub	M	Bulldog, English	5	57.0	59.5	4.4
5	Duke	F	Retriever, Labrador	1	89.0	96.0	7.9
6	Ellie	M	Golden Doodle	1	47.0	47.5	1.1
7	Lucy	F	Great Pyrenees Mix	6	94.5	104.0	10.1
8	Roman	M	Great Pyrenees Mix	6	111.0	118.0	6.3
			Avg	2.9	65.1	69.9	7.4

Mass balance

A simple mass balance was conducted for each pet based on the difference between the mass of the feed the pet consumed and the mass of feces the pet produced during the 30-day trial.

The mass of feces were estimated by weighing collected feces on three of the feeding trial days and taking an average. All weights were reported as dry matter (no moisture). Data from the mass balance was used to calculate the mass assimilation (or the amount that was retained by each dog) of the feed. Results are shown in Table 3 and Figure 1. Appendix A shows images of feces for each dog enrolled in the study. Images of feces were taken by pet owners during weeks 0, 1, 2, and 3. Pet owners were instructed to use the same camera (typically their cell phone) for each image, a similar background and light source, and to fully frame the subject.

Table 3. Mass balance and % assimilation for each pet in the test panel.

					A	B	Ratio	% mass
					Input	Output	out/in	Assim.
	Pet	Sex	Breed	Age	g/day	g/day	A/B	(1-B/A) *100
1	Bean	M	Terrier, Yorkie-poo	1	89.9	11.0	0.12	87.8
2	Bear	M	Shepherd Mix	1	547.0	24.3	0.04	95.6
3	Bryn	F	Collie, Border	2	300.1	8.7	0.03	97.1

8	Roman	M	Great Pyrenees Mix	6	620.0	28.0	0.05	95.5
			Avg	2.9	402.3	16.5	0.0	95.1

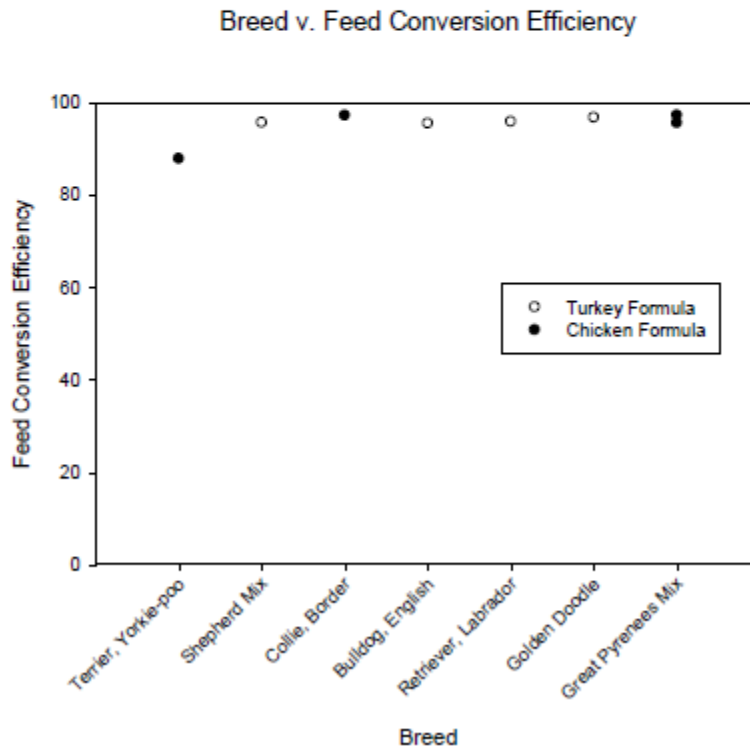

Figure 1. Feed conversion efficiency for all dogs in the study.

Energy analysis

An energy balance on the pet food was conducted using the mass balance and bomb

calorimetry data for the feed and feces. Results of the energy balance are given in table 5 and figure 2. [Measured moisture content of the feed: for Turkey, 11.46% moisture; for Chicken, 17.60% moisture].

Table 5. Results of energy balance calculated for the pet food study.

	Pet	Breed	Age	Sex	Formula	Energy	Energy	Net	Net Urine	%	%

					Average	0.7	20.8	20.1	18.4	96.5	88.6

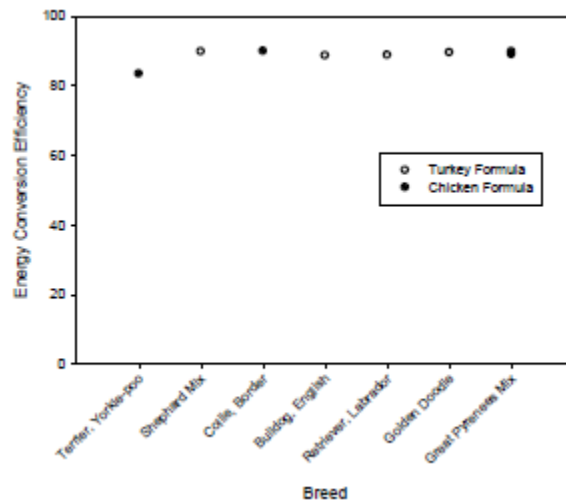

Figure 4. Adjusted feed energy conversion efficiency (adjusted for estimated loss in urine) for all dogs in the study.

Veterinarian Test Results and Opinion

Pet dogs in the trial visited a local vet for an examination within 5 days prior to the beginning of the study and for a second time during the last 5 days of the study. Exams were conducted at Trinity Veterinary Hospital, Stillwater Oklahoma. Attending veterinarians were Dr. Carey Bonds, DVM and Dr. Kent Williams, DVM. The first exam included a fecal sample analysis, urinalysis, blood analysis and a wellness check. The purpose of the fecal sample analysis was for parasite screening. Pets with parasites were to be treated or removed from the study. Bear was the only dog diagnosed with worms. He was treated by Dr. Williams and remained in the study.

Dr. Bonds provided a summary of the results of the test that included her opinion about the health of the pets during the study. Overall, she found that all of the dogs were healthy and no significant changes were noted as a result of the pets' participation in the study. The complete submittal she provided with her opinion is found in Appendix C.

Conclusions

Feces Analysis

Pet dog feces were photographed and collected during the feeding period and evaluated for appearance and specific energy. All feces collected were medium to firm in texture. Three of the pet owners mentioned that their dogs had soft stools, but none were wet and all were within the normal range of expected values for healthy dogs. The energy values of the stool ranged from 11,840 to 17,319 with an average of 14,972 kJ/kg. The values are consistent for healthy pet dogs consuming dry foods.

Pet weight

Eight healthy pet dogs of various breeds, ages, and temperament participated in the test. The average change of weight for the entire test panel was 7% during the study. The highest gain was 14%, which was for a growing Shephard Mix that turned one year old just prior to the study. Most of the dogs (6 out of 8) gained weight during the study. This was attributed to the palatability of the Wisdom and its feed efficiency and high energy content. Of the pets that gained weight, their owners were surprised that their pet gained, and claimed that it seemed like they were feeding their pet less than they had in the past. This observation is consistent with the feed efficiency and energy content of Wisdom. The only dog with a weight loss was a Terrier/Yorkie-poo mix that lost 3% during the study. The owner was not alarmed and thought that the dog was perfectly healthy. The standard deviation of the % weight difference of the pet dogs during the study was 5.2 %.

Mass balance

A mass balance was calculated based on the feed input and feces output during the study. The results were used to calculate the average adjusted assimilation $((1 - \text{output/input}) \times 100)$, or feed efficiency, which was 95%. The range for assimilation was (87.8, 97.1) with a standard deviation of 2.9. The mass balance and calculated assimilation were very good for a dry dog food. For reference, the AAFCO diet allowances are based on feeds with a minimum of an 80% efficiency.

Energy balance

An energy balance was calculated based on the calculated energy of the feed input and feces output. The results were used to calculate the average efficiency $((1 - \text{output/input}) \times 100)$, which was 97%. The range for efficiency was (92.5, 98.1) with a standard deviation of 2.1. After adjustment for estimated energy losses through urine (5.23 kJ/g digestible protein consumed), the efficiency was 89% with a range of (83, 90) and a standard deviation of 2.2. The calculated energy efficiency was extremely good for a dry dog food.

Veterinarian Examinations and Report

The attending veterinarians at Trinity Veterinary Hospital in Stillwater Oklahoma found no significant changes in the health of the 8 dogs that participated in the test. The Veterinarians noted that 6 of the dogs gained weight during the test. This has been attributed to the high palatability, high energy content, and high metabolizability of the Wisdom dog food.

APPENDIX A
PHOTOS OF PET FECES

APPENDIX C
VETERINARIAN EXAMS

Trinity Veterinary Hospital - Pet Mech Study March 2020 to April 2020

Veterinarian	Client First Name	Client Last Name	Pet Name	Starting weight	Ending weight	Physical Examination Changes	Bloodwork changes
Bonds	Pam		Chub	57	59.5	Weight gain	No significant changes
Bonds	Pam		Duke	89	96	Significant weight gain	No significant changes
Bonds	Carnille		Bean	10.5	10.2	No change on physical examination	No significant changes
Williams	Jodi		Ellie	45.5	47.5	Weight gain	No significant changes
Bonds	Kim		Lucy	94.5	104	Significant weight gain	No significant changes
Bonds	Kim		Roman	111	118	Significant weight gain	No significant changes
Bonds	Bryn		Nicola	40	42	Weight gain	No significant changes
Williams	George	Hannon	Bear	71.5	81.6	<p>Bear had Hookworms at the start that were treated with Panacur. This is likely the reason for his elevated Eosinophil count. Bear gained a significant amount of weight during the trial (10.1 pounds). Bear also had an elevation in his Creatinine at the end of the study. It was recommended to recheck his Creatinine in another month and could consider testing his SDMA to further check for early kidney disease. Furthermore, his Eosinophil count had continued to increase so a HWT was performed to rule out Heartworm disease as a potential cause. The exact cause of the Eosinophil elevation is unknown.</p>	See Physical examination changes notes

**Endocrinology**

4/28/20

7:51 AM

TEST

RESULT

REFERENCE VALUE

Total T4

a

2.0

1.0 - 4.0 µg/dL

a

Diagnostic Interpretation for TT4

< 1.0 µg/dL Low

1.0 - 2.0 µg/dL Low Normal

1.0 - 4.0 µg/dL Normal

> 4.0 µg/dL High

2.1 - 5.4 µg/dL Therapeutic

Dogs with no clinical signs of hypothyroidism and results within the normal reference range are likely euthyroid. Dogs with low T4 concentrations may be hypothyroid or "euthyroid sick". Occasionally, hypothyroid dogs can have T4 concentrations that are low normal. Dogs with clinical signs of hypothyroidism and low or low normal T4 concentrations may be evaluated further by submission of freeT4 (fT4) and canine TSH. A high T4 concentration in a clinically normal dog is likely a variation of normal; however elevations may occur secondary to thyroid auto antibodies or rarely thyroid neoplasia. For dogs on thyroid supplement, acceptable 4-6 hour post pill total T4 concentrations generally fall within the higher end or slightly above the reference range.
