Planting Instructions

1. Ensure all buried facilities are located.
2. Dig hole 2 to 3 times the width of container and to the same depth.
3. Remove plastic container and place rootball in hole. Ensure the root ball is at or slightly above ground level. If your plant has a fiber pot, leave it on and cut slits through sides and bottom.
4. Backfill with original black top soil from hole, amend with compost, manure and/or Zeolite.
5. Water well with root promoting fertilizer. May require daily watering while establishing itself the first year. Ensure root ball does not dry out or stay too wet as both can cause damage. More details on reverse page.
6. If using mulch, do not cover trunk of plants or trees.
