What are essential oils?

A variety of plants cover the Earth in different shapes, sizes, colors, and scents. Many of these plants contain compounds that typically can't be seen with the naked eye—they hide within the roots, flowers, seeds, bark, or other areas of the plant. These compounds are known as essential oils. They are highly concentrated, making them extremely potent. Also referred to as volatile aromatic compounds, essential oils give a plant its aroma, protect it from harsh environmental conditions and insects, and even play a part in plant pollination.

The science behind essential oils

When you hear the word “volatile,” you may think it holds a negative connotation; however, in the case of essential oils, volatility refers to a substance's ability to change its state quickly. The chemical makeup of volatile aromatic compounds in essential oils allow them to disperse quickly through the air. This is why you can instantly smell the potent aroma of an essential oil from the moment you open the bottle—even from a distance.

As volatile aromatic compounds move quickly through the air, you will experience the scent when the compounds interact directly with sensors in the brain. (You'll learn more about how essential oils interact with the brain in chapters two and three).

With over 3,000 types of volatile aromatic compounds discovered so far, it is important to note that these compounds greatly determine the benefit, aroma, and nature of each essential oil. Because of unique chemical makeup, each essential oil will vary from species to species, and even from plant to plant.

volatile aromatic compounds:

Tiny, organic molecules that are known to quickly transform from their liquid or solid state into a gas when they reach room temperature.

Peppermint *Mentha piperita*

As we inhale the distinct aroma of an essential oil, the scent is processed through the olfactory system in the brain. The brain's olfactory system is responsible for controlling the sense of smell.

Essential oil use throughout history

While some view essential oils as a new trend, the use of plant extracts and plant-based products is deeply rooted in traditions of the past. Ancient civilizations used plants for things like aromatherapy, personal care, health care practices, religious ceremonies, beauty treatments, and food preparation. The infographic below shows that essential oil use is not a fad, but rather a long-time tradition started centuries ago in civilizations all over the world.

 **Egypt:** Egyptians used plant-based products in beauty treatments, food preparations, burial rituals, and religious ceremonies.

 **Greece:** In ancient Greece, men like Homer and Hippocrates explored the aromatic uses of plants, building on discoveries made by early Egyptians.

 **Rome:** Ancient Romans often used plant extracts for massage, perfume, and scented baths.

 **Iran:** In medieval times, people in the region of Iran often used and traded spices or resins for perfumery and maintaining health.

 **India:** Ayurvedic medicine, a holistic healing system native to India, has developed over the span of 5,000 years and includes the use of aromatic and plant compounds.

 **China:** For centuries, traditional Chinese practices have included the use of plant materials to promote wellness.

 **France:** Rene Gattefosse, a French chemist, is credited as the first to coin the phrase “aromatherapy” as he studied and researched essential oils thoroughly in the 19th century.

As you can see, plant extracts have been used throughout history and all over the world for a wide variety of purposes.

The use of plant-based products has been recorded as far back as 3000 BCE with the Egyptians, who used plant extracts for dozens of tasks. When analyzing the mummy of ancient Egyptian ruler, Ramses V, the aromatic compounds of juniper, camphor, and myrrh were discovered, which confirms their use in sacred burial rituals.

Around 2000 BCE, Europe's first civilizations were emerging in Greece, bringing with them an interest in perfumery and other plant-based treatments. Men like Homer and Hippocrates took the traditions of the Egyptians and began to learn more about aromatics and plants. Their research permeated throughout Greek culture, influencing the practices of the time. There is written documentation of solvent extractions that used wine and fat sources to pull the volatile compounds from plants.

In ancient Rome, aromatic compounds were a vital part of culture and health. Romans were known to use plant extracts for things like scented baths, massages, and perfumery. Scientific literature from this time period shows that plant extracts and aromatic compounds were widely used for their health benefits.

In medieval Persia (now known as Iran), many people harnessed the power of plants and regularly traded resins and spices that were prized for their many benefits. Avicenna, a Persian doctor, wrote extensively on health and wellness and is credited as the father of aromatherapy as we now know it.

Ayurvedic practice has developed over the span of 5,000 years in India—it consists of using the Earth's elements to find balance in the body, and, in turn, good health. Today, the majority of people in India follow the Ayurvedic tradition exclusively or combine it with Western practices.

Between 500 and 1300 AD, China was a leading world power with advances in science and technology that superseded any other civilization of the time. Extensive research was done during this time, leading to many advances in the usage of plants and plant parts. To this day, traditional Chinese practices are still used, and still rely on the use of various plant materials for health and wellness.

A major historical shift began in the 19th century when new developments in chemistry increased the sophistication and understanding of essential oil extraction methods. During this time, Rene Gattefosse (a chemist and perfumist) coined the phrase “aromatherapy.” Medical doctors in France dispensed essential oils in their practice and still receive some medical school training regarding their safety today.

How are essential oils made?

Now you know that essential oils are derived from plants, but you may be wondering, “How does it work?” It is important to note that not all essential oils are created equal. The purity of an oil can change depending on geographic location, distillation methods, weather, and other factors. Additionally, no matter how well a plant is selected, cared for, and harvested, the quality of an essential oil can either be preserved or destroyed during the distillation process. Because of the attention to detail and precision necessary in distillation, it becomes less of a process and more of an art form. Distillers must be precise and pay careful attention to harvesting methods, temperatures, time of distillation, the amount of pressure used, etc.

How does a plant become an essential oil?

The exact process for producing an essential oil will vary depending on what type of plant the oil comes from. However, the basic idea is that plants go through a specific distillation process using special machinery in order to separate the essential oil from its plant parts. As mentioned earlier, the essential oil hides within different parts from the plant, often in microscopic amounts. During the distillation process, the machinery will separate the essential oil from its original plant part. For example, when citrus oils are produced, machinery is used to separate the essential oil from the rind of the fruit.

The flowers of the jasmine plant are used to produce a potent essential oil with a lovely aroma. Once the flowers blossom, it doesn't take long for them to lose their volatile aromatic compounds, so it is crucial that they are harvested at the right time in order to preserve the chemical profile. The flowers must be harvested early in the morning before the buds have had time to fully open—even waiting an hour too long will cause important chemical contents to be lost.

When you understand what essential oils are, where they come from, and that they've been used safely for centuries, it is easy to see that they are not an unexplained mystery, but a practical tool to be used in everyday life. If you are still wondering how essential oils might be applicable to your lifestyle, keep reading to learn about the uses and benefits they hold for individuals of all walks of life.

CHAPTER

Why use essential oils?

While essential oils and plant extracts have been used for centuries, essential oils still hold relevant applications today. With advancing technology, improved quality, potency, and safety, essential oils are now more accessible and easy to use in everyday life. Although essential oils were often used as a part of cultural practices and traditions of the past, we now have increasing scientific evidence and research to show the effectiveness and safe nature of essential oils in our day and age. Historically, essential oil usage was both popular and practical, but we now have resources and research that make essential oils useful in daily life, for a variety of people.

Essential oil everyday use

Each individual has their own set of needs and preferences. Luckily, essential oils are versatile enough to provide a wide range of benefits for anyone who uses them. Some people think they need professional training in order to use essential oils, but with a basic understanding of how essential oils work, it is easy to include them in your everyday routine.

If you are wondering, “Do I really have a need for essential oils in my normal, everyday life?” answer the questions below to see how essential oils might fit into your daily routine:

- Q: Do you worry about using household cleaners that may expose your children to harsh chemicals or toxins?
- Q: Do you ever look for ways to strengthen damaged hair or a distressed scalp?
- Q: Are you ever in need of products to keep your skin feeling and looking healthy and young?
- Q: Do you ever experience occasional digestive discomfort?
- Q: Do you ever experience discomfort associated with occasional tension in the neck or head?
- Q: Do you suffer from discomfort associated with seasonal and environmental threats?
- Q: Are you ever in need of products to help support a healthy immune system?
- Q: Do you enjoy adding powerful and natural flavors to your entrees, beverages, or desserts?

If you answered “yes” to any of these questions, you might have more use for essential oils in your life than you think. While some view essential oils as mysterious or complicated, they can be used for household cleaning, cooking and baking, improving well-being, and more. Along with the applications for everyday life, many enjoy essential oils because of their health benefits, as well as their positive effects on emotions.

Using essential oils for health benefits

In ancient times, people used essential oils and plant parts to improve their health and well-being. Because essential oils can be used to soothe occasional skin irritations, promote healthy digestion, support good oral health, create feelings of clear airways, and more, they have long been a popular choice for those who want to maintain good health.

As mentioned, essential oils offer a variety of benefits, and each individual experiences essential oil use in their own way. Fortunately, the diversity of essential oils makes them a helpful way to maintain health, even for those who have specific health concerns, seek diverse health benefits, or experience sensitivity. Using essential oils for health benefits has become popular because it allows you to tailor the experience to your specific wants and needs, rather than settling for a generic solution.

The emotional benefits of essential oils

With unique chemical structures, each essential oil holds a variety of benefits for the user. Some essential oils hold soothing, toning, and grounding properties, while others are known as energizing, uplifting, warming, or renewing. As our bodies go through an array of emotions and physical states throughout a single day, essential oils can help us manage and maintain well-being.

The chemical design of an essential oil gives it specific benefits. Some essential oils are helpful for cleansing or purifying, while others provide a soothing sensation to the skin. The aroma of essential oils can also create a chemical reaction in the brain, eliciting emotions and internal responses.

When you inhale a deep breath of an essential oil from the bottle, the oil's scent is processed in the olfactory system of the brain through the olfactory nerve. The olfactory system is the part of the brain that is in charge of controlling your sense of smell. The olfactory system connects to the limbic system, where your emotions and memories live. As you

breathe in the scent of an essential oil, the limbic system creates a response in your brain based on your memories associated with that particular aroma. Many times, the responses triggered by your limbic system can be emotional responses that are calming or uplifting, depending on the unique chemical structure of the oil. More importantly, because responses in the limbic system are based on memory, each person experiences each essential oil a little bit differently.

Here are a few examples of chemical properties that can be found in essential oils:

Restoring: These are oils for emotional and physical support. They are meant to help revive, strengthen, and rejuvenate the body and the senses.

Uplifting: These oils are meant to be inspiring. They encourage feelings of exhilaration, refreshment, and enlivening.

Energizing: These oils are used to bring feelings of motivation and activation. They tend to be brisk, naturally stimulating oils that help wake up the mind and body.

Clarifying: Topically, these oils are used to improve skin tone and appearance, and aromatically they can be used to help settle and resolve ambiguous, uncertain feelings.

Calming: These oils are helpful for relaxation, both physically and mentally. They are typically used for stress relief, meditation, and preparation for sleep.

Soothing: These are oils that help to ease and alleviate issues, both emotional and physical. They are meant to reassure and console as needed.

Stabilizing: These are oils that help steady the nerves and encourage more even, balanced emotions.

CHAPTER

How do I use essential oils?

Now that you know what an essential oil is and where essential oils come from, it is time to learn how to use them. Once again, you don't need to be an expert to enjoy the wide variety of benefits that essential oils hold. All you need is a basic understanding of how to safely and simply use essential oils during your daily routine.

Aromatic Use

One way to experience the benefits of essential oils is aromatically, or by breathing them in. Using essential oils aromatically can offer many benefits; however, it can be particularly helpful for improving or managing mood. Depending on the chemical structure of an essential oil, it may provide invigorating or uplifting effects, or it might produce calming or soothing feelings.

Studies have shown convincing evidence that simply inhaling the aroma of an essential oil is effective for calming nervous or anxious feelings in a variety of settings.

Diffusion

Diffusion is one of the most effective ways to enjoy essential oils aromatically and is most efficiently accomplished by using an essential oil diffuser. Essential oil diffusers take a whole oil and transform it into a mist, or microscopic droplets, that allow you to experience the aroma of the essential oil for an extended period of time.

It is important to remember that essential oils have a delicate chemical structure, so you never want to use a diffuser that could alter the chemical profile of the oil by using heat. It is best to stick with diffusers that use water or cold air to diffuse the oil.

While diffusers make it easy to use essential oils aromatically, you can also reap the aromatic benefits of an essential oil without a special diffusing device. Simply inhaling an essential oil straight from the bottle, or placing a drop in your hands, rubbing the palms together, and inhaling the scent will allow you to yield the benefits of essential oils through the air.

Ideas for aromatic application

-  Spritz essential oils on clothing for a long-lasting, pleasant scent
-  Place a drop of oil in your hand, rub the palms together, cup the hands over your nose, and inhale
-  Drip two to three drops of oil on the floor during a hot shower (keeping oil away from the water path), and breathe in
-  Mix oil with water in a spray bottle and mist over carpet, furniture, or other linens in the home
-  Apply oil to a cotton ball and place in the air vents of your vehicle
-  Add a drop of oil to a dryer sheet to give a batch of laundry a clean, fresh scent

Safety Tip: Typically, aromatic use of essential oils is considered very safe and tends to be well tolerated by most individuals. However, as with any application method for essential oils, it is important to consider doses and appropriate use. For maximum benefits, diffusion should be used multiple times throughout the day, in small doses.

Topical Use

Applying essential oils topically is a safe, effective way to yield the benefits that essential oils hold for the skin and other aspects of the human body. Due to their chemical makeup, essential oils can easily penetrate the skin and offer a localized benefit to the applied area. Essential oils are easily absorbed into the skin; however, you can prolong the benefits of an essential oil by using a carrier oil to slow down the evaporation of the oil, allowing it to moisturize the skin.

What is a carrier oil? Carrier oils are lipid-based substances that can be used to dilute essential oils. The carrier oil will literally help to 'carry' your essential oil to the desired area. Using a carrier oil like Fractionated Coconut Oil allows you to effectively apply an essential oil topically without altering the potency of the oil. When you dilute an essential oil, it enhances absorption by increasing the surface area of absorption, and helps prevent skin sensitivities.

Remember, deciding when and how to dilute your essential oils is a personal decision that should be based on the oil's chemistry, your usage preferences, and any personal sensitivity to certain oils.

Skin sensitivity and dilution

If you have particularly sensitive skin, or when applying essential oils on children, it is a good idea to use a carrier oil like Fractionated Coconut Oil. By diluting the essential oil with a carrier oil, you can avoid the development of a skin sensitivity, especially when you are trying a new oil for the first time.

Some essential oils should always be diluted when used topically. Always follow usage suggestions for oils like Cinnamon, Geranium, Lemongrass, and Oregano, as they should always be diluted before topical use.

Recommended dilution ratio: 3 drops of carrier oil to 1 drop of essential oil.

How to apply essential oils topically

Beneficial Areas to Include:

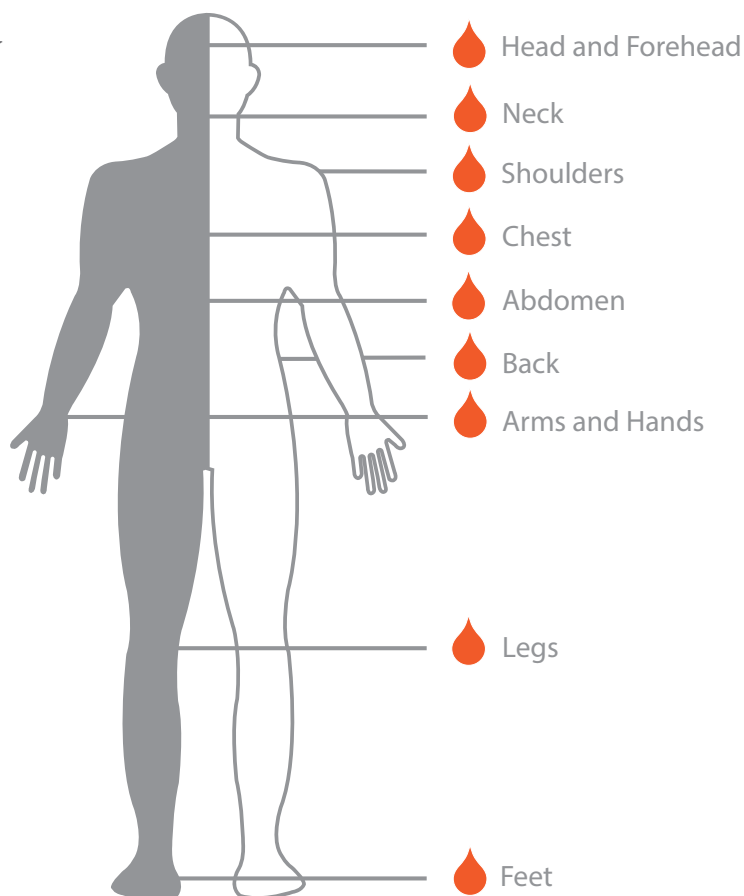

- Neck
- Forehead and temples
- Chest and abdomen
- Arms, legs, bottom of feet

Sensitive Areas to Avoid:

- Certain facial areas, like the skin around the eyes
- Inner ears and eyes
- Broken, damaged, or injured skin

Other Effective Methods of Topical Application:

- Place a few drops of oil in a warm bath
- Make a hot or cold compress by soaking a cloth in water, adding two drops of essential oil, and then apply to the desired area
- Mix a few drops of essential oil with lotion or a daily moisturizer and apply to the skin

Internal Use

Though internal use has been greatly debated in the essential oil community for years, research continues to confirm the safety of internal application and validate its many uses. It turns out, essential oils are most likely already a big part of your daily diet. A large portion of the plants that we consume throughout the course of a day produce small amounts of essential oil.

How internal usage works

When you ingest an essential oil, it directly enters your blood stream through your gastrointestinal tract, where it is then transported throughout the rest of your body. As mentioned before, essential oils are lipid soluble, allowing them to be easily transported to all of your organs—including the brain. Just like everything else we consume, an essential oil can be metabolized by organs like the liver and then excreted. While using essential oils internally is perhaps one of the most potent methods, our bodies are quite accustomed to

and well equipped for metabolizing essential oils when given in a proper dosage.

Toxicity

As with anything we consume, it is always important to ensure that essential oils are used in appropriate doses in order to avoid toxicity. Toxicity refers to the point at which a substance becomes harmful or damaging to the body. Remember, seemingly harmless substances like water, vitamins, and minerals (substances that are vital to life) can all be toxic when consumed at an inappropriate dose. While essential oils have the potential for toxicity, the toxic dose of an essential oil is always far above the recommended appropriate use.

Internal use should be considered on a case-by-case (or oil-by-oil) basis

When it comes to using essential oils internally, you'll need to consider the specific chemistry of the oil, its possible effects, appropriate doses, and application methods for each individual oil. It is important to note that some essential oils simply cannot be used internally—in any amount. Perhaps even more important, the ability to use an essential oil internally will also depend on the quality of the oil itself.

Effective methods for internal application:

- Add essential oils to your favorite recipes by replacing fresh or dried herbs and spices with a drop of oil when cooking or baking
- Place essential oil drops into a veggie capsule and swallow with water (this excludes oils that should always be diluted—Cassia, Cinnamon, Oregano, etc.)
- Add an essential oil to a glass of water, your morning smoothie, milk, tea, or your other favorite beverages
- Place a few drops of an essential oil into a small amount of yogurt or applesauce

What oils should I start with?

Whether you are using essential oils aromatically, topically, or internally, you might be wondering about the best place to start. At d TERRA®, we suggest starting with simple essential oils that have a variety of applications so that you can get used to the potency, power, aroma, and characteristics of essential oils and how to use them. When you are first starting out, consider using any or all of the oils below:

Lemon essential oil is one of the top selling oils at d TERRA, and with good reason. If you are looking for an uplifting, versatile oil to start off your essential oil collection, Lemon is an excellent choice.

If you are looking for an introduction to the world of essential oils, Lavender oil is a wonderful oil to start with. Not only does Lavender provide a calming, pleasant aroma, but it is very useful in everyday life as well.

When you want to experience the potent power of essential oils, Peppermint oil can be used topically, aromatically, or internally for impressive results.

- Reduce the appearance of skin imperfections or soothe occasional skin irritations by applying Lavender oil to the skin
- Place a few drops of Lavender oil in your essential oil diffuser to help ease feelings of tension
- Promote an environment for restful sleep by adding a few drops of Lavender oil to bedding, pillows, or the bottoms of your feet before bedtime
- Add flavor to marinades, desserts, and other baked goods or soften citrus flavors by using Lavender oil when cooking
- Combine a few drops of Lavender oil to a spray bottle of water and spritz over your mattress, couch, or in the linen closet to add freshness

- Place a few drops of Lemon oil in your diffuser to help create an uplifting environment
- Soak a cloth or rag in Lemon oil and use it to protect, clean, and shine wood finishes around the home
- Add a few drops of Lemon oil to a glass of water for a more refreshing beverage
- When you need to remove grease or residue from your hands, wash with Lemon oil and water
- Add Lemon oil to a spray bottle of water and use it to clean countertops and other surfaces
- Use Lemon essential oil in an oral rinse to soothe the mouth and throat

- Freshen your breath by placing one drop of Peppermint oil in your mouth
- Place a few drops of Peppermint in your essential oil diffuser for an invigorating aroma
- Add Peppermint oil to your shampoo or conditioner to give yourself a stimulating hair massage
- When you want a morning energy boost, rub Peppermint oil on your temples when you first wake up
- Diffuse Peppermint oil to help promote feelings of easy breathing and clear airways
- Add two to three drops of Peppermint to your favorite smoothie recipe for a refreshing twist

CHAPTER

Are essential oils safe?

When you use high quality essential oils in the appropriate amount, they can absolutely be safe enough to use at home on yourself and your family. High quality essential oils will have gone through extensive testing to ensure they are safe, are pure, and have the correct amount of concentration. Like anything else that you would use in your home or on your children, essential oils are safe when you adhere to recommended dosage amounts and use them within proper parameters.

Among the many benefits of essential oils, one major advantage is that they offer peace of mind to parents who worry about using chemical-ridden products on their children, or in the home for cleaning, cooking, and other tasks. Essential oils are a safe alternative to many of the products you see on grocery store shelves that contain synthetic toxins or chemicals that could be harmful. Learning about proper use and dosage will allow you to safely use essential oils at home and on your family, while enjoying the benefit of a natural product.

General guidelines

The amount of essential oil you'll use will depend greatly on your own personal health status and your level of experience with essential oils. To remain within the parameters of safe usage, always consider the advice of your healthcare provider before using essential oils. Using an essential oil in the way and amount that it was intended will help you prevent overwhelming the body with incorrect essential oil levels.

Aromatic guidelines

As with all application methods, diffusion should be used in smaller doses, multiple times throughout the day to achieve the maximum benefits. The amount of oil diffused, proximity to the diffuser, and size of the room will determine how long an oil should be diffused. The more oil used and closer proximity to the diffuser, the more potent the effect will be. If you are using a water-based diffuser, it is generally recommended to use 1-5

drops of oil per diffusion period. It is best to start with short diffusion periods (15–20 minutes) and then increase the time as needed to achieve the desired benefits.

Topical guidelines

Because essential oils are so potent, it is always advisable to use several small doses throughout the day rather than a single large dose. Start with the lowest possible dose (1–2 drops) and then increase the dose as necessary to achieve the desired benefit. A topical dose can be repeated every 4–6 hours as needed. Because every individual is unique, the dose will vary for each individual based on size, age, and overall health status.

Internal guidelines

When using essential oils internally, it is important to regard them with as much precaution as any other supplement. It is best to start with the lowest possible dose (1–2 drops) and then increase the dose as needed. The recommended internal dose of essential oils is 1–5 drops, depending on the oil or blend. After a certain point, taking a higher dose no longer adds benefit. If you take too much, it can even become harmful. It is better to take a smaller dose, which can be repeated every 4–6 hours as needed. In total, typically no more than 20 drops, divided into doses, should be consumed in a 24-hour period. The maximum dose may be lower or higher for some oils. A lower daily dose is recommended for extended internal use. Remember, there are some essential oils that are never safe for internal usage—this is why it is of vital importance to read all labels before consuming.

How can I be sure that I'm using essential oils safely?

Always keep the safe amount-per-day guidelines in mind.

Avoid applying oils directly to the nose, ears, or around the eyes.

For topical application, it is important to consider dilution. Dilution helps you avoid sensitivity with essential oils, and is particularly helpful for young or small children, or those with sensitive skin. It is also important to remember that some essential oils (Cassia, Cinnamon, Geranium, Lemongrass, Oregano, and Thyme) should always be diluted before topical use.

Make sure to store essential oils out of the reach of children. This will help prevent accidental ingestion.

When storing essential oils, you'll also want to keep the oils away from excessive light or heat, because this can alter the chemical properties of the essential oil significantly.

Always help younger children apply essential oils to make sure they get the proper amount. It is also a good idea to encourage teenagers to set a good example for younger children by always following guidelines for proper usage.

GLOSSARY

Aromatic Use: Essential oils can be used aromatically to enjoy the aroma of an oil through the air by diffusing the oil in an essential oil diffuser, or by inhaling the oil straight from the bottle.
