

Mynute X

Regarding, Maximum flue lengths.

With a concentric 60/100 flue the maximum length must not be exceeded in any circumstance.

The prescribed max length is **10.0m** for Mynute X 20R.

For the 30R 30C 35C and 40C models the Maximum length is **6.0m**.

There is **no** requirement to adjust fan speeds for concentric 60/100 flue systems.

The table of adjustments in the manual refers only to two pipe H1 systems where the intake and output ducts are precisely matched; these are not available for NZ installation.

When calculating maximum flue length, each 45° bend should be considered as 1.0m and each 90° bend as 1.3m.

If a concentric flue is too long it will cause combustion imbalance and potentially flame drop out

With concentric flue close to its maximum length be very conscious to ensure the flue terminal is not vulnerable to outside influences.
