

KAT Explosion Samples - 2nd round

The 2nd round of color matching for the mauve wine color has yielded [Delta E](#) 2000 levels of under 2 and has been approved! A Delta E of under 2 means the human eye sees the displayed colors as they were originally intended to be shown.

Please note that the samples shown below are for the purpose of analyzing legends/novelties only. The plastic used was recycled, hence you will see color inconsistencies that will not be present in the production keycaps.

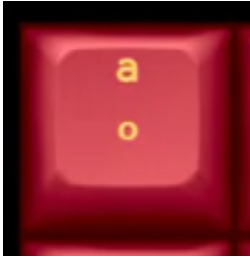

Important Observations:

Please note that there are discrepancies in physical samples of legends with respect to legends on renders. These discrepancies are due to the limitations of doubleshot legends vs dyesub legends. These changes below have been accepted.

Physical Sample	Render
	
	
	
	

Although the superscript legends are larger than the renders, they are smaller with respect to non-superscript legends.

Issues being addressed with Keyreative:

Underside plastic showing through the topside plastic

Inconsistent line thickness

Smudges/blemishes that are not removable
