HABISHIELD™

Antimicrobial Defense

- ✓ Newborns are birthed in a non-sterile environment with little, if any, defense to protect them from the bacteria and/or viruses present in the pen. Their nose, mouth and umbilical cord is subject to this non-sterile environment and acts as a conduit for bacteria to enter their body.
- ✓ In addition to Iodine, applying HABISHIELD directly to the umbilical cord and surrounding area, will help speed the drying process of her umbilical cord and help keep it clean until it fully heals.
- ✓ Habishield's proprietary formulation is an excellent sanitizer against a broad spectrum of bacteria's and viruses that are present, including Cryptosporidium, Rotavirus, E Coli, Coronavirus, and Biofilms.

Super Absorbent Drying Powder

- ✓ Young animals (calves, goats, sheep and swine) have little subcutaneous fat (fat just under the skin) which leaves them with minimal insulation. Newborns that experience difficult birthing or experience poor respiration struggle more to regulate their temperature.
- ✓ Drying helps a newborn to better regulate her body temperature. Otherwise, heat is removed from the animal as the water evaporates. This leaves the newborn highly susceptible to chilling, and wastes the newborn's energy.
