1. VOX control adjusts voice activation sensitivity.
2. MUSIC INPUT audio dims when VOX opens mic.
3. LED blue indicates power is on, red indicates transmitting.
4. CELL INPUT audio unaffected by VOX.
5. VOL / POWER controls intercom volume and power.

Intercom Operation

Power On / Off the intercom by rotating the volume control clockwise / counterclockwise.

VOX Adjustment

Rotate the VOX and VOLUME all the way clockwise, putting the mic in an open state. Listen for the ambient sound picked up. Slowly rotate the VOX counter-clockwise one click at a time until the ambient noise is silenced. Now set VOLUME at about 50%, position the mic AGAINST THE LIPS, and begin speaking normally. You should hear your own voice (Side-Tone). Adjust volume for comfort. If your voice does not open the mic, increase VOX slightly (clockwise). If the mic opens too easily, decrease VOX slightly (counter-clockwise).

NOTE: Audio played through the MUSIC port will attenuate or “dim down” when VOX activates. Audio played through the CELL port will not.

PRO TIPS
• The higher the background noise level (engine, wind, etc.), the further counterclockwise you will need to adjust the VOX control.
• Be sure to have all helmet / headset microphones positioned so they are touching the lips. This ensures proper microphone activation and promotes noise canceling.
• If the music is always quiet, adjust the VOX control on the intercom until the mic turns off and music volume increases.
• Only driver can speak on cell phone call.

2-Way Radio Use

Received audio is controlled by your radio’s volume control, not the intercom volume control. Push-To-Talk (PTT) Buttons are only used for transmitting over a 2-way radio connected to your intercom. To transmit, press and hold the PTT button, speak, then release when finished.

PRO TIPS
• PTT buttons only activate one microphone (ie: Driver PTT activates Driver microphone). If receiving radios do not hear your voice but hear a “click” indicating your radio is transmitting, verify that your PTT and headset cables are in the correct ports.
• When transmitting the LED on both the intercom and radio will illuminate red.
• The radio’s hand mic is incompatible with intercom systems. We do recommend storing it in the vehicle in case of emergency (in which case, power off the intercom).

Bluetooth

Bluetooth audio can be added to the RRP660 using Rugged part number WM1-6P.
If using optional Audio Filter, connect radio and intercom power leads directly to Audio Filter and NOT to the battery.

**This is a universal wiring diagram. Your exact configuration might vary depending on the system purchased.**

**Radio & Intercom Mounting**
- HEADSETS connects driver and co-driver headsets to intercom. Route away from power and antenna cables.
- PUSH-TO-TALK connects driver and co-driver PTT to intercom.
- CREW connects additional headsets to intercom.

**Connect Power**
- Power connect +/- directly to 12v battery.
- Route all power cables directly to the battery, away from other power/headset cables.
- DO NOT connect inline with other components. If power is tied to ignition, lights or other power sources, a ground loop problem may occur, causing noise in the system.
- DO NOT remove any fuses that are in line with factory cables or otherwise modify power cables.

Both the intercom and radio come with universal mounting brackets. Vehicle specific mounting options are sold separately.
- DO NOT mount the radio or intercom near an ignition box to avoid RF interference.
- Route antenna cable away from power leads and headset cables.
