

Which records should i add to make my email working? (SPF, MX, DMARC)

For essential **outgoing** and **incoming** email functionality with your MailWish Business Email Hosting, these steps are a **must to set setup in your domains**.

Let's get started:

Please ensure that only Mailwish records exist; **remove any other MX/SPF records and make sure there only one SPF record**, as having additional records may disrupt sending and receiving functionality.

How do I set up the DNS records?

Step 1: Log into your DNS provider and access your domain.

Step 2: Add the following records to your domain:

SPF Record (For Outgoing Emails):

- Type: TXT
- Hostname: @
- Value: v=spf1 include:mailwish.com ~all
- TTL: 300 or the minimum possible

Which records should i add to make my email working? (SPF, MX, DMARC)

MX Records (For Receiving Emails):

- Type: MX
- Hostname: @
- Point: mail.mailbux.com or by server name <servername>.mailbux.com
- Priority: 10
- TTL: 300 or the minimum possible
- Type: MX
- Hostname: @
- Point: mail-relay.mailbux.com or by server name <servername>-relay.mailbux.com
- Priority: 20
- TTL: 300 or the minimum possible

Optional but Recommended: Protect Your Business from Spoofing To safeguard your business and enhance security, consider adding a DMARC record. Create a new TXT record with the following value:

- Type: TXT
- Hostname: @ or your domain name
- Value: v=DMARC1; p=quarantine; rua=mailto:dmarcreports@[replace-with-your-domain].com

Make sure to replace “Yourdomain.com” with your actual domain.

To ensure the validity and visibility of these records, we recommend using this online tool: [MX Toolbox](#).

Bonus:

Enhance Deliverability with DKIM (Optional) You can further improve email deliverability by setting up DKIM. Check out our guide on [How to Set Up a DKIM Record](#).
