

1 1/8" HEADSET CAP TEMPLATE

Well, there it is. Doesn't look like much does it? That's where you come in. You can design pretty much anything your crazy brain can dream up, we'll just give you a few tips to make sure your creation lasers just like you want it to.

1. Lasers only see in black and white. Make sure your artwork is bold and simple. If you want to replicate shades of gray, you need to use halftones, dither patterns, etc. If you don't know what those are, keep it black and white. Black areas of your design will laser white. White (or clear) areas of your design will show the anodization color of your cap.
2. You can use any typefaces (fonts) you want. Just make sure to convert them to outlines before you send in your creation. That way, if we don't have that crazy font you used, your design will still look great.
3. You can use bitmap, hand drawn and scanned images in your design. Just be sure that they are high resolution (at least 600 dpi) and, as we mentioned above, only simple/clean black and white. No grayscale or color please. The laser will get mad and ignore your job. You don't want to make the laser mad. Trust me.
4. Your amazing design can reach all the way to the edge of the cap (and even bleed off the edge of the cap, but please make sure important info is kept away from the very edge.
5. Remember, the smaller inner circle represents the bolt hole of the cap. That part of your art will not show in your final cap. It falls through the hole and ends up in bolt hole heaven.
6. Artwork that is not submitted in using one of our template files will, unfortunately, be rejected and your order will be refunded. You have been warned, but we still love you ;)
