

How to Save with Prefilled Syringes

Save time, improve patency rates, reduce animal numbers

The tool to make your lab more **efficient and productive** while **reducing study dropout**.

Prefilled syringes from SAI are available in a range of sizes with the solutions and caps that suit your study. These valuable tools not only **save time**, but can **improve study outcomes**. Prefilled syringes are manufactured under clean room conditions with human grade pharmaceutical ingredients which means **less worry** about patency loss and study drop-out.

SAI Prefilled Syringes

Time Savings

It's easy to see how prefilled syringes can save time for your technical staff, allowing them to use their time for more skilled tasks. Don't forget that prefilled syringes can also save time for:

- Purchasing agents- no need to go searching for suppliers. We have done the homework on the syringes, caps, needles and solutions that you need. The same is true for invoicing.
- Chemists- if you are customizing your fill solutions, you might be relying on a chemist to mix the solutions. Put their time to better use.
- Inventory Managers- Fewer parts to keep on hand means fewer items to track and control.

Researcher Benefits

The CDC recommends prefilled solutions to reduce the risk of infection in human populations. Why? In one human study,

An 8% increase in contamination occurred when syringes were filled by in-house staff.

Contamination can lead to infection, but it can also cause inflammation. Both of these issues can affect patency of the catheter as well as the health and longevity of the animals on study.

The SAI Impact

Your staff don't always have the time, tools, or techniques to complete the task. Whether you are managing one of these issues or all of them, SAI can help.

- Quick turnaround on orders
- Manufacturing in clean room conditions with pharmaceutical grade ingredients.
- Kits customized to your needs with the solutions, volumes, and fittings that work for you.
