This report replaces report no. 2112080011 dated 08.12.2021.

Interpretation:

The NMR profile is typical for honey, however following deviation(s) could be detected:
 The sugar mannose was found in a significant concentration. Mannose is only observed naturally in honeydew honeys or honeys of certain monofloral varieties (and mixtures thereof), but is regularly observed in industrially produced sugar syrups. The varieties of honey in which mannose can be found naturally include heather, chestnut, eucalyptus, pine, linden, jujube, avocado, bracatinga, metcalfa, fir and others.
 An increased content of ethanol could be detected in the NMR analysis, which can give a hint to ongoing or stopped fermentation. It is recommended to determine the exact glycerine or yeast content, as well as the organoleptic properties, in order to check whether the sample fulfills the legal requirements according to "Council Directive 2001/110/EC relating to honey, dated Dec. 20th, 2001; Article 1 in connection with Annex II."
 The proposed geographical origin "India" could be confirmed after applying statistical classification models and expert assessment.
