

Cleaning dried milk from the Z6 milk frother.

Remove the milk tube shown behind the red arrow.

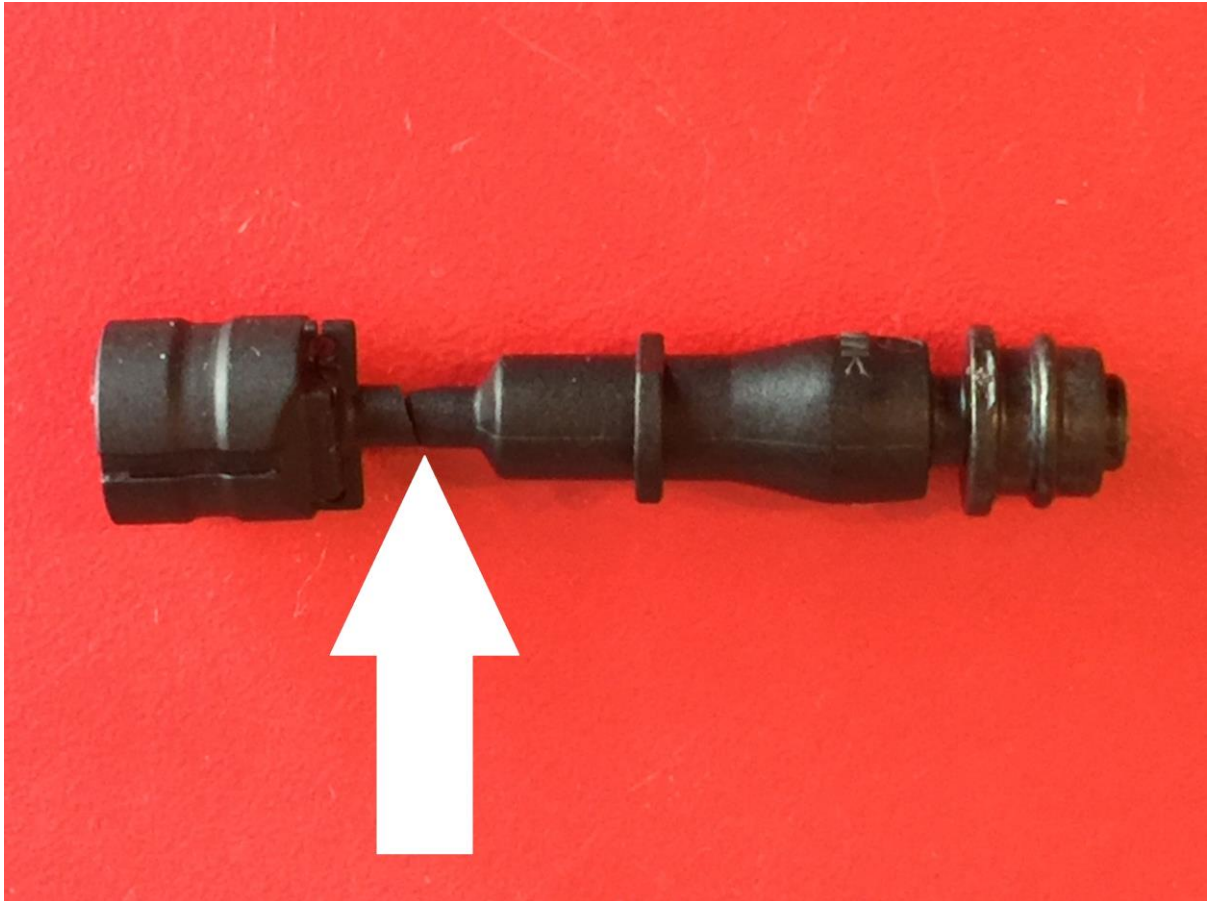

Lift off the top right double outlet indicated by the blue arrow.

Open up a paper clip and insert it where the red arrow is and push it all the way to the right inside.

You should be able to see the end of the paper clip if you look down where the part with the blue arrow was removed.

Press and hold in the plastic square indicated by the white arrow and move the paper clip left and right to clear away any dried milk.

**Do not use a pin or needle as this can damage the unit.**

The part arrowed is the area inside which we are trying to clean, it is sealed and non removable, this is the part that will be damaged if a pin or needle is used.

A paper clip is ideal as it has a flat end and will not puncture the rubber inside.
