Re: Alberto Salazar
DOB: 08/07/1958

To Whom It May Concern:

Mr. Salazar has been my patient since 02/07/2005.

I have provided primary care as an internal; medicine physician for Mr. Salazar. Mr. Salazar has a long history of hypogonadism with significant symptoms. This is evidenced medically by multiple low testosterone serum levels, along with typical symptoms seen with this condition. For treatment of this medical condition, I have prescribed testosterone replacement therapy. This treatment has been reviewed with Dr. Caufield, the treating cardiologist for Mr. Salazar's cardiac condition, a deemed to be medically safe given the well controlled nature of the historical cardiac condition. The prescription is carefully monitored, and filled at the same pharmacy always used by Mr. Salazar, and in a quantity sufficient to treat only Mr. Salazar. I carefully monitor the level, and with blood tests have shown efficacy and safety. This is, the testosterone level is replaced to a normal level. The testosterone replacement therapy has been ongoing as medically indicated and necessary since at least 2005.

Sincerely,

A handwritten signature in black ink, appearing to read 'Kristina Harp', written in a cursive style.
