

FIRE PIT SCREEN USE & CARE SHEET

Your screen is made to last and to withstand the elements, but there are a few things you don't want to do.

- 1** Use your screen under normal use. Do not put your screen over a large Bonfire type of fire. If you consistently are burning large fires through the screen, then you will eventually wear out the metal. The screens are designed to catch sparks, not large flame.
- 2** Use and source quality firewood that will not produce a ton of spark. Kiln dried firewood is the best you can purchase.
- 3** No chemicals. Do not squirt any chemicals such as lighter fluid through your screen. Chemicals can cause the metal to get thin and eventually fail.
- 4** Do not cover your screen. You do not want to trap moisture inside of a cover and your screen. Moisture if trapped will eventually rust the screen and if you leave it covered for a long period of time it could rust through the screen. Do not use a tarp or other type of cover. You should be taking your screen off at the end of the night and placing your snuffer lid over the pit to ensure the fire is out and to make sure no water is getting into the pit. Wet ash turns into lye and lye is a corrosive chemical that reacts with metal.
- 5** Paint your screen from time to time with a high temperature paint. Depending on how much you use it, this will also help to protect your investment in a quality screen.
