

Good morning Linda. I would like to show you the special bra you need to wear after your heart surgery. It's called QualiBra Advanced.

Why can't I just wear my own bra after surgery?

Because standard bras create cleavage. You have probably experienced heat build-up and moisture there, right?

Yes, I think all women can relate to that.

Heat and moisture on fresh wounds can cause infections or other problems that we want to avoid after surgery.

Oh yes, definitely.

Also, normal bras close behind your back. After surgery, you have to avoid reaching behind your back like this while your breast bone is healing as that strains your bone and may delay healing.

I understand. So what is different about the bra I have to use?

The QualiBra Advanced keeps the wound area free, dry and clean. This will also get a nicer looking wound healing.

That would be fantastic! I worry about having an ugly scar afterwards.

And it closes at front so you don't have to reach behind your back. Let me show you how to regulate the space between your breasts.

It feels very comfortable and soft.

Yes, and we can also regulate the bra at the sides of the breast like this. It will prevent the breast weight from pulling on the wound.

That is really something! But tell me what this blue band is for?

Of course, Linda, The blue band is to give constant support from the lateral sides of your sternum bone. This will help to stabilize and protect the bone during healing.

Looks really like everything was considered about how I can protect my wound!

Yes, and there's more. These 2 pockets act like handles and when you bring them together with your fingers it gives you more support around your chest. This lowers pain when you need to cough, sneeze, or if you have to strain during visits to the bathroom!

Now I see why I cannot use my own bra after surgery.

Good. And QualiBra Advanced helps us nurses too! We can easily access your wound without having to open the bra!
