Process technology

AIR HEATER MODEL HS 3000 ELECTRONIC
AIR HEATER MODEL HS 3000 ST

■ The new FORSTHOFF air heaters HS 3000 electronic and HS 3000 ST

The air heaters HS 3000 electronic with variable temperature settings and HS 3000 ST with 3 heating levels are modern and versatile hot air generators which can be used for many purposes.

The appliances are connected up to an external air supply and thus are suitable for permanent use with conveyor belts, in machines and numerous other possibilities of use in different industrial manufacturing processes. Further, they are used in heating ducts and with various appliances.

Here the hot air they generate may be used for activating, shrinking, drying and forming.

The air heaters HS 3000 ST and HS 3000 electronic come in two versions: as switching device with 3 heating levels in 230 V alternating current and as electronic version with variable temperature settings in 230 V alternating current or 400 V three phase current.

The compact casing with square design can be assembled without any problems. Thanks to an adapter plate, the new air heaters can simply replace the production series of the previous model Type 3000 E.

HS 3000 ST and HS 3000 electronic require an external air supply with fan, side channel blowers or compressors. The necessary amount of air is – according to nozzle – 500 to 1,500 litres / minute. If necessary, the air discharge can be changed with diverse clip on nozzles. The air heaters generate a maximum temperature of 700 °C.
