

HEATSHEETS P1 (01)

Installation Instructions

Specification; 26"/66cm wide, Fully UV Stabilised

GENERAL INFORMATION

Heatsheets were first developed in Scandinavia, where horticulturists have claimed up to 50% savings on their fuel bills - considerably more than when plain polythene sheeting is used.

The material is made from two layers of polythene welded together forming air pockets which, together with the greenhouse glass, create a triple-glazed effect.

Lining just the walls of the greenhouse will give considerable heat savings but for maximum savings we recommend total lining or completely lining a section of your greenhouse.

Your order has been supplied in one continuous length for you to cut to your exact requirements reducing waste. Cutting may be done with a sharp pair of scissors or sharp knife. The precise method of fixing varies from greenhouse to greenhouse but our general suggestions are given below.

SIDES AND ROOF

1. Attach string tightly along both the eaves and the ridge of the greenhouse.
2. Cut lengths sufficient to cover the two walls and the two sloping sections of the roof.
The number of lengths required will depend on the length of your greenhouse.
3. With bubbles to the glass, feed a length up one wall, behind the eave string, up over the ridge string and down behind the opposite eave string.
Repeat with the other lengths, slightly overlapping each length.
4. For aluminium greenhouses we recommend Super Alliplugs, Alli-Spacers and Corner Adaptors if necessary.

ENDS

1. String tightly from one eave corner up to the ridge and down to the opposite eave corner.
2. Cut the material to the required length and angles and secure with the fixings.
3. For Doors and Roof Vents it is suggested that the material is cut to the size of the glass and attached using double sided or All Weather Tape.

This suggested 'stringing method' is not entirely necessary if using Fixing Aids, but it will save you from having to use too many. It also helps support the material whilst fitting.

HINTS

- Use Heatsheets bubbles to the glass.
- Keep the material in as large a piece as possible to avoid too many joints.
- Use double sided tape and all weather tape to seal any overlaps and seams.
- If removed carefully in the summer Heatsheets will last for several seasons.
- Please Note.

This material represents a potential safety hazard and **MUST** be kept out of reach of children.
