

Weeping Garden Hose

Q16 (12)

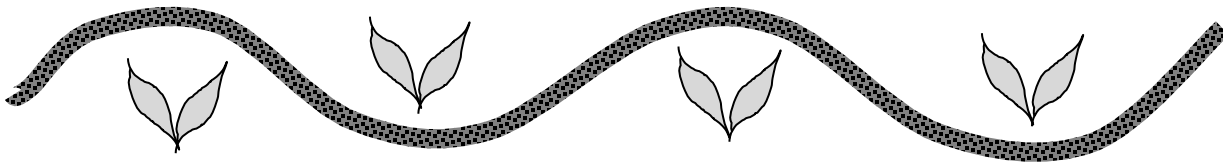

The Weeping Garden Hose has been developed to run from a mains supply only and can deliver up to 6 liters of water, per meter, per hour depending on pressure and flow rate.

The hose itself can be laid on the surface or, to help reduce loss through evaporation, can be buried up to 6" deep delivering water directly to where it's needed.

Each line can water up to 50cm (20") in width.

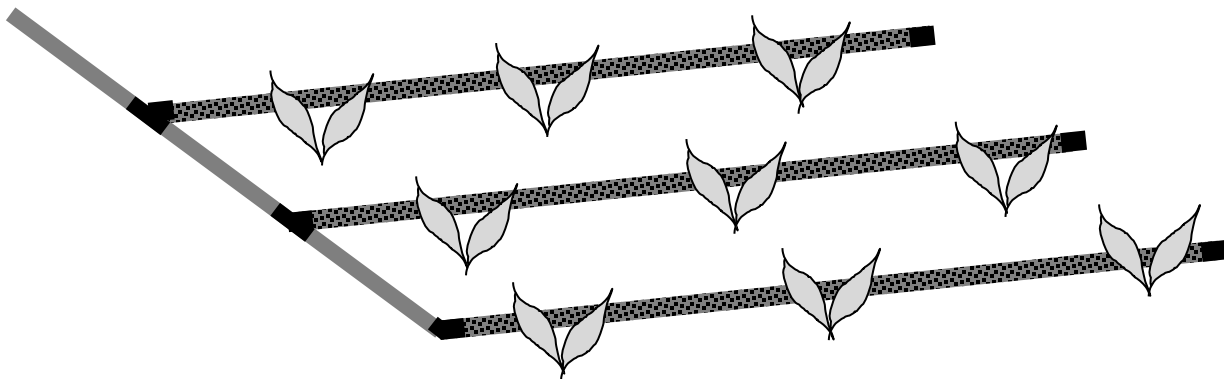

The most effective ways of laying out the Weeping Hose are;

To "Snake" it around the plants and area to be watered.

In Parallel Lines.

Use normal hosepipe to deliver the water to the area as required. Using T's, elbows, straights and end plugs, branch the weeping hose off to form rows.

Ring.

For larger, established shrubs or trees form a ring around the base using "T" connectors.
