

SkyRest®

U.S. Patent # 6647573

Congratulations! You have purchased SkyRest™ a unique travel pillow. Although SkyRest™ can be used anywhere, the primary intended use for it is while sitting in a commercial airline seat. Its patented design is one of the first to use the natural tendency of your head to tilt forward due to gravity to help you get comfortable. Rather than relying on the ability to lean back in your seat as with most travel pillows, SkyRest™ recognizes that this is not always easy or possible. Even if you can lean back, the angle may be too small to allow sleep without your head falling forward and instantly waking you up! To use SkyRest™ you lean forward rather than backward to rest your head. SkyRest™ does not require any particular configuration of the seat. It doesn't matter if the seat tilts back, how high the seat back is or where or even if there is any sort of head rest.

Since it is an inflatable device and designed to inflate and deflate very quickly, it can be packed into your carry-on luggage and inflated once you are in your seat. It is very lightweight and can easily be moved around to allow for passenger traffic. We sincerely hope that SkyRest™ helps you to get many hours of rest on your flights and other travels!

To use your SkyRest™ please follow these instructions:

IMPORTANT: SkyRest™ has a combination inflation/deflation valve that must be used correctly to avoid difficulty with deflation. It is highly recommended that you practice these steps at home prior to using SkyRest™ on the airplane. It is not difficult but neither is it completely straightforward or intuitive. Furthermore, deflation of SkyRest™ is impossible unless you remove the deflation cover as described below.

Note: The combination inflation/deflation valve is designed to be pushed into SkyRest™ when inflated. Initially the valve comes in this position. When deflated, the valve can be pushed out from behind to gain easier access to the inflation tube. Once inflated the valve can be pushed in or left out to allow easy access to the valve covers and body.

Inflation Instructions

The removable inflation/deflation valve has a one-way valve that keeps air from exiting the pillow while you are pausing to take a breath. While it is possible to inflate SkyRest™ completely by mouth through the inflation valve, experience has proven that the best way to inflate SkyRest™ is to follow the steps below.

To inflate: Start with the deflation valve removed. To remove it, see deflation instructions below. With the valve removed there is a gaping hole that will allow air to easily enter(or exit) the pillow. Next, pull out the corners of the pillow to form it into its inflated shape i.e. roughly a cube. (See figure A below). With the pillow formed into its inflated shape, it is now mostly filled with air. Now, just screw in the deflation valve and complete the inflation by mouth via the inflation tube(see figure 2). From this point it should only take a half dozen breaths to top it off.
