

Forticept® Advanced Animal Care Products

CASE STUDY Forticept® Blue Butter™ & Maxi-Wash™ Clinical Efficacy Assessment

Location: Veterinary Clinic
 Species: Canis
 Breed: Beagle
 Age: 3
 Gender: Male
 Condition: Moist erosive pododermatitis on hind leg
 Location on patient: Hind right leg
 Product(s) used:
 Forticept® Maxi-Wash™ & Blue Butter™ Antimicrobial Gel

A 3 year old male castrated Beagle presented for the examination with acute moist erosive pododermatitis on hind right leg. He was severely itchy and painful on the lesions. Upon examination, the dog's paw appeared red and inflamed, warm to touch.

A swab of the affected area was taken and sent to the microbiology lab to be cultured. The skin cytology revealed numerous rod and cocci-shaped bacteria.

The animal was treated with topical application of Maxi-Wash spray and Blue Butter gel 2 times in 24 hours. The next day his skin lesions almost completely resolved. After an additional day of topical treatment, all skin lesions were in complete remission.
