

SilentWool Joist

Acoustic Insulation strips for joists.

Made from 100% Pure Sheep Wool

SilentWool Joist is the natural and effective way to reduce structureborne sound transmission caused by contact between joists and floor / subfloors.

Thickness 3mm

Roll Length 10m

Roll Width 100mm

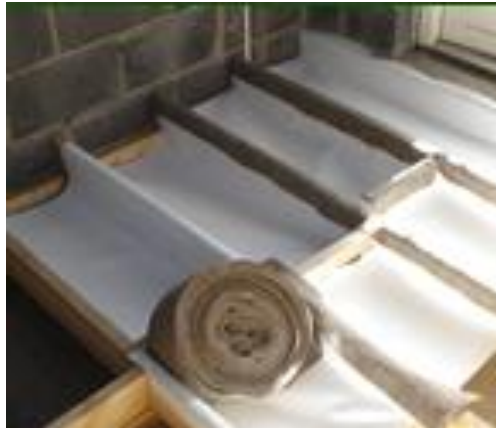

SilentWool Joist is rolled out on existing timber joists prior to wooden floors or subfloors being laid down. The impact of footsteps for example is absorbed by the 3mm thick wool quilt that lies under the floor. This will reduce the effective noise heard in the rooms below....

Tools required: Scissors, measuring tape and staple gun.

Preparation : The joists must be thoroughly clean and dry.

Installation: Install SilentWool Joist by unrolling along the joist and folding at each side. Staple the folded side into the side of the joist to ensure hold when fitting the floor.

The picture below shows SilentWool Joist installed over suspended timber floor joists, where between the joists are also insulated with **100% Pure SheepWool** Insulation rolls.
