Instructions for: **European Skull Bleach Kit**

Clean skull of as much meat and tissue that you can remove with a knife.

Prepare a pot of water with 4 oz. of Sal Soda to each 5 gallons of water. Bring to a rolling boil and immerse skull. Cook at a rolling boil for 15-20 minutes. Remove and scrape remaining tissue from bone. Return to boiling water and repeat until bone is clean.

Note: The object is to remove the maximum amount of meat and fat in the shortest amount of boiling time. This will prevent damage to the bone. Try to clean skull within 30-60 minutes.

Once clean, place the skull in a pail of clean, hot water while you prepare the bleaching mixture.

Mix Basic White with 40-volume hydrogen peroxide to form a white froth comparable to shaving cream.

Remove skull from clean water and pat dry. For whitest results, apply to damp skull.

Paint Basic White/Peroxide mixture onto skull until completely covered.

Allow to air dry, usually overnight.

Wash skull free from dried bleach mixture with clear running water and allow to dry.

At this point, skull should be very white. If any areas remain unbleached, repeat the process.
