

— Step-by-Step —
Math to Mastery
FOR SPECIAL EDUCATION & INTERVENTION

*Preview &
Sample Lesson*

Hello!

I'm excited to show you my updated Step-by-Step Math to Mastery™ resources!

This preview will answer several frequently asked questions and give you a chance to see a sample lesson straight from the workbook.

If you have more questions or would like to request a product catalog don't hesitate to email me.

Angela Dansie

angela@mathtomastery.com

Have a question? Click to the Answer

Are these resources standards-based? Evidence-based? [ANSWER](#)

Will they be a good fit for my students? [ANSWER](#)

Do students respond well to these lessons? [ANSWER](#)

How do you teach a lesson? [ANSWER](#)

How do you prep and organize materials? [ANSWER](#)

What is the recommended sequence of workbooks? [ANSWER](#)

Can I share this with another teacher? [ANSWER](#)

How can I get a discount? [ANSWER](#)

Standards-Based

K-5th grade standards addressing numbers, addition, subtraction, multiplication, division, fractions, and decimals are covered.

The lesson workbooks are linked to Common Core State Standards so the standards can be referenced when writing IEP goals. Not every math standard is taught. These resources are focused on mastering essential foundational skills in a straightforward way.

An example IEP goal and objectives are included in each lesson workbook, along with the corresponding standard(s).

Evidence-Based

High-Leverage Practices in Special Education found in Step-by-Step Math to Mastery materials include:

- #12 Systematically Design Instruction Towards Learning Goals
- #14 Use Cognitive and Metacognitive Strategies (Schema Instruction)
- #15 Provide Scaffolded Supports
- #16 Use Explicit Instruction

Teacher-directed instruction is explicit and systematic. Skills are broken down into small steps, reducing cognitive load. Lessons progress incrementally from basic to more complex procedures. Clear, precise language is used so teachers and paraeducators can explain model problems simply and consistently.

Word problems are taught using schema-based instruction.

Special Learners

Step-by-Step Math to Mastery™ resources were created for students who need extra support, preferably in a small group or 1-on-1 setting. These lessons have been used in special education classrooms, intervention groups, Title 1 and English language learner programs, after school tutoring, and in homeschools.

Many math books simultaneously introduce two or more problem-solving strategies. This often confuses struggling students. In these lessons, only one strategy is taught at a time for students to master before moving to the next step.

These lessons could benefit all students, especially students who have:

- **Attention difficulties**—minimal visual clutter, short lessons, simple instructions, clear stopping point
- **Learning disabilities**—objectives are carefully sequenced in small chunks with explicit step-by-step instruction and many practice repetitions
- **Slower processing speed**—accuracy is emphasized rather than speed; mastering a skill will increase automaticity
- **Language difficulties**—
Receptive Language: Teacher directions and vocabulary are simple, consistent, and concise.
Expressive Language: Rather than asking students with limited verbal skills to ‘explain their thinking’, teach them how to state the steps they are following.
- **Executive functioning difficulties**—clear expectations and predictable routine, organized layout with white space and fewer problems per page
- **Fine motor issues**—larger font and space for writing answers; students are not asked to write many words or sentences

Student Success

I get feedback from teachers and parents of students in elementary, middle school, and high school. What I love most is hearing about a student's success.

I am using several of these units with a couple of students who experienced prenatal alcohol and drug exposure . . . I **have seen them go from being completely overwhelmed and shut down in math to being excited to show me their progress each day.** I cannot recommend these highly enough!
–Melissa H.

This is hands down the best math resource I have found. My daughter wasn't retaining info from our previous curriculum so we were in need of a new approach. She has actually **retained what she is learning** with this. –Shelly G.

I've been looking for a good math intervention program for my students and this one is awesome! **My students are making so many gains! One of my students felt so successful that he asked for homework!** I liked this so much I got the entire program!
–Jacqueline R.

This resource is amazing!! I have used it with my 3rd grade math intervention groups and my students are actually adding and subtracting with borrowing and regrouping. **I have seen such a huge growth** since using these pages!
–Kelsie L.

I love the **confidence** this gives my students! –Kate S.

Amazing! Used in a resource room and students and their parents kept commenting how they wished the classroom teacher used this program. Highly recommend! –Jennifer M.

My students really enjoy this math. It is easier for them to understand than the curriculum the school is using. They need something very clear and straightforward and this is IT! –Tracey M.

I love the approach and routine to your math units and the multiplication was no exception! **Students with Intellectual Disability were multiplying with pride and parents were very tickled!** Great evidenced-based structure.
–Melissa G.

Simple steps and explanations **helped my ELL students tremendously.** –L. G.

My intervention students have blossomed with using this resource. It is extremely thorough and guides the students through scaffolded steps to achieve competency. Couldn't ask for a better resource! –Lindsey D.

My 4th and 5th grader students with learning disabilities are **finally feeling successful in math!** –Kimberly D.

I used this resource to teach a child from Somalia how to regroup with subtraction. The explicit instruction was instrumental in helping the child conceptualize regrouping. I also appreciate the numerous sheets available for additional practice. Thank you! –Baudelina A.

This was exactly what I was going for. I've been using it all school-year and **I've never seen my kids make progress like they have.** –Danielle D.

Lesson Presentation

There is not just one right way to use the workbooks. They can be adapted to your student needs, your setting, and time constraints.

General guidelines for how to present model problems and prompt student responses are found on the next page.

Here is how I use the lesson workbooks:

My setting is a small group pull-out at the elementary level (mild/moderate). Students sit at a kidney table facing me and a white board behind me.

Warm-up:

- We begin with a number sense & place value warm-up.
- This may include skip counting, missing number flashcards, and a page from a daily practice workbook.

Model: 5 minutes

- I state the lesson objective and write one model problem on the white board at a time and think out loud while I demonstrate each step.
- I ask students to repeat and recite the steps, rules, and vocabulary with me.

Guided Practice: 10 minutes

- During guided practice I continue working problems on the board. I ask students for the next step as if they are coaching me through the problems.
- When they are answering confidently, I often have a student come to the board to work a problem. I've found students enjoy the chance to "be the teacher" and it gives the others a chance to practice being a respectful audience.

Independent Practice: 15 minutes (more or less)

- Students spread out and go to their individual tables/desks where they can focus quietly during this time.
- They work at their own pace, quietly, and raise their hands when finished so I can quickly check their work and give immediate feedback.
- Quick finishers might be given a set of fact flashcards or a fluency timing to practice while the others finish.

When I have a group that is answering accurately and flying at a faster pace, I reduce the number of practice problems and may do two lessons a day.

If we have time, we do a few word problems together or practice telling time or counting money—whatever I'd like to spend a few minutes reviewing.

Keep Students Engaged

"A responding student is a learning student."

Model each skill step-by-step and think out loud while you demonstrate. Give many opportunities for each student to respond during *guided practice*. Don't move to *independent practice* until students are confident with the skill.

Model: Teacher solves problems on the white board or on the paper so everyone can see. Talk through the problem out loud, step by step.

I look at ...

I think ...

I see that ...

I write ...

I remember ...

I say ...

Have students recite the steps and any new rules or vocabulary as you work.

"I add the ones column. What do I do?"

"The rule is ... Say it with me ..."

"(Vocab word) means ... Say that with me ..."

Guided Practice: Teacher and students work problems together. Solve together on the white board, projector or teacher's paper.

1. Start → Teacher models correct response before asking a question
"First we look at the sign. What do we do first, everyone?"
2. Fade to → Whole group choral responses
"What is the next step, everyone?"
3. Fade to → Individual responses
"What numbers are in the tens column, ... Andrew?"
4. Fade to → Solve on individual papers at the same time
Individual responses as you go through the steps together and students write on their papers
"Count back, ... Hailey." "What is the difference, ... Max?" "Everyone write it."

More Options →

- Invite students to come to the board and demonstrate solving problems and talking through the steps. Give each student a chance to be the "teacher" while others practice being a respectful audience.
- Pair students up with a partner. Both solve the same problem, then they quickly compare answers. Or they may take turns demonstrating how to solve a problem while the other watches and checks the answer.

Independent Practice: Students work quietly at their own pace. They may ask for help if needed, but encourage and praise independent work.

Easy to Teach

I know how many things special education teachers have on their plates. It is important to me to make these resources as simple to use as possible.

"I was so scared to buy this [K-5 Math Bundle] because of the price but after 2 months it has **easily saved me that much time** spent after my contracted hours putting things together. I can just **hand it to my paras and they can teach the students without me micromanaging.**" –Whitney H.

The practicality of these units is off the charts!!! They make math time **so much easier for me to plan!!**
–Janelle M.

As a special ed teacher who provides push-in support to students at a variety of levels, your math interventions have been a **lifesaver** this year! I'm able to pinpoint where to start my kids, can **easily align it to the standards**, and I don't end up spending hours sifting through websites online trying to find math work that will fit my kids' needs. Thank you! –Kimberly D.

This is a **godsend for teachers who have to program for a wide range of abilities, simultaneously.** –Juliana R.

I love all of your bundles. They **make doing math a breeze** with my kiddos. It used to take me hours to prep and think of what to do – because I have **four different levels in my classroom**. Now I just follow your curriculum for each different level. Thanks for your great stuff. –Marci G.

This resource is **easy to use for my students and paras.** Thanks! –Rachel W.

I was looking for a resource for my 1st and 2nd grade resource room. General education materials made teaching math cumbersome. I felt like I spent more time teaching the various components of the program and teaching math was secondary. This is just what I needed to **make math manageable** for my special learners. I love that examples are concrete and instruction is direct. Thank you so much!
–Sherri H.

This is a great resource for math rotations. I teach 4-8 AU/ED/ID in a self-contained classroom in a public separate school. My **capable para is able to implement this easily and it is effective** in teaching the students.
–Emily S.

This is an excellent resource for those self-contained special education teachers that have to reinvent the wheel to put together a curriculum to meet the needs of their students that are not low enough to take the alternate assessment.. –Success Beyond the Box Teaching Materials

I can't say enough about this resource. Best I've ever bought from TPT. I have four grades in my classroom, at the same time. **This makes math time stress free, while everyone works on what they need to target.** Thank you!
–Everyday I'm Teaching It

It works perfect for having a para work with the student. –Jennifer B.

Prep & Organize

Once you have decided which lessons to teach, you may want to print and bind individual student workbooks.

1. Print the student booklet cover onto colored cardstock for a bit of durability
2. Print the lesson pages double-sided. Black & white, no color ink needed.
3. Bind the workbook together using what you have (staple, spiral binding, three-hole punched in a binder, or with binder rings)

In my classroom . . .

- I would plan what I would teach the coming month and spend an hour of my prep time printing and assembling student workbooks.
- The method I used was a double-hole-punch at the top, fastening booklets together with two 1" binder rings. I fastened workbooks at the top to avoid anything on the sides interfering with handwriting.
- Each math group had a separate Sterilite™ bin to store the workbooks in as well as any flashcards or base ten blocks or other manipulatives.
- After students finished a workbook I would take the binder rings out and staple the book to send home. Then I re-used the binder rings in the next workbook.

I know these lessons are a lot of pages, and it can be a concern when you are limited in the number of pages you may print and copy. If you live in an area with a print shop it may be worth looking into having them printed there if your school will reimburse you.

Printed coil-bound workbooks are available at mathtomastery.com so you can save your prep time for other things and have professionally printed workbooks delivered to your door. Just another option to consider!

Suggested Sequence

Placement Test

Visit mathtomastery.com to download a free placement test.

Step-by-Step Math to Mastery™ Lesson Workbook Sequence

Basic Addition and Subtraction

- 1. Addition and Subtraction: Numbers to 10
- 2. Addition and Subtraction: Word Problems
- 3. Addition and Subtraction: Three Addends and Teen Numbers
- 4. Addition and Subtraction: Fact Families, Missing Addends, Making Ten

Multi-Digit Addition and Subtraction

- 5. Addition: Two- Three- and Four-Digit Numbers
- 6. Subtraction: Two- Three- and Four-Digit Numbers

Basic Multiplication and Division

- 7. Multiplication: Concepts and Factors to 10
- 8. Division: Concepts and Divisors to 10
- 9. Multiply & Divide: Word Problems, Missing Factors, Fact Families

Multi-Digit Multiplication and Division

- 10. Multiplication: One-Digit by Multi-Digit Factors
- 11. Multiplication: Multi-Digit Factors and Distributive Property
- 12. Division: Long Division with One-Digit Divisors
- 13. Division: Long Division with Two-Digit Divisors

Fractions

- 14. Fractions: Basic Concepts
- 15. Fractions: Representing Fractions on a Number Line
- 16. Fractions: Add and Subtract Like Denominators
- 17. Fractions: Multiply Fractions and Convert to Mixed Numbers
- 18. Fractions: Add and Subtract Unlike Denominators
- 19. Fractions: Divide and Simplify Fractions

Decimals

- 20. Decimals: Read, Write, Compare and Round
- 21. Decimals: Add and Subtract, Multiply and Divide
- 22. Decimals: Convert Between Percent, Decimals, and Fractions

Suggested Sequence

Supporting Resources

Number Sense & Place Value

- Numbers 0 to 20 Count, Read, & Write Numbers
- Numbers 1 to 120 Place Value & Number Sense Daily Practice
- Numbers 120 to 999 Place Value & Number Sense Daily Practice
- Hundreds: Expanded Form, Comparing, & Rounding Off
- Thousands: Expanded Form, Comparing, & Rounding Off

Fact Fluency

- Addition & Subtraction Timings, Flashcards & Games
- Multiplication & Division Timings, Flashcards & Games

Other

- Telling Time to the Nearest 5 Minutes
- Counting Money: Coins and Dollar Bills
- Shapes: Flat and Solid Practice Sheets

These resources may be used alone or with the computation lesson workbooks on the previous page.

Number sense and place value practice sheets are a great daily warm-up routine or entrance activity.

Fact fluency timings: Addition timings may be started after students can add sums to 10. Multiplication timings can begin after students have learned to multiply by 5's, 2's, and 3's.

Telling time and counting money may be taught any time after students are confident skip counting by 5's.

Sample Lesson

In this sample you will see:

- Table of Contents
- Example IEP Goal & Objectives
- Overview & Suggestions for Use
- 2 Lessons

A few things to notice as you look at the lesson . . .

Consistent & Predictable Format:

- “I Can” statements at the top of each page state lesson objective
- Model (I do), Guided Practice (We do), Independent Practice (You do)
- Uncluttered. White space and fewer problems on each page

Open and Teach. Paraeducator-Friendly.

- There is no separate lesson plan or teacher manual. The lesson workbook contains all that is needed for both the student and teacher.
- Steps to follow are printed next to each model. These written steps can be used to help the teacher “think out loud” while demonstrating.
- This makes it easy to give to a paraeducator to use. S/he doesn’t need a detailed script because the lessons are formatted to be predictable and simple. Once familiar with the format, adjustments can easily be made to the number of practice repetitions each student needs.

On some pages there may be quite a bit of text. Please realize that the written step-by-step instructions on each page are to help the teacher be clear and consistent during modeling and guided practice, not for the students to read and make sense of independently.

Step-by-Step Math to Mastery™

Percent, Decimals, & Fractions

Table of Contents:

Introduction	Pages
Standards and IEP Goals	5
Overview and Suggestions for Use	6
Student Booklet Cover	7

Lessons	
Convert a Fraction to a Decimal	8
Divide and Round Off Repeating Decimals	13
Convert a Percent to a Decimal	18
Percentages More or Less Than 100%	23
Multiply by a Percent	31
Find a Percent "of" a Number	40
Percentage Word Problems	48
Review and Test: Percentages to Decimals	59
Convert a Decimal to a Percent	63
Convert a Decimal to a Percent (Add Zeros)	68
Convert a Fraction to a Percent	75
Convert a Fraction to a Percent by Rounding the Decimal	81
Write the Fraction for a Word Problem	89
Solve Word Problems	94
Review and Test: Fractions to Decimals to Percentages	104
Appendix: Common Percentages to Memorize	108

Percent, Decimals, & Fractions Standards & IEP Goal

Fifth Grade CCSS.MATH.CONTENT.5.NBT.B.7

Add, subtract, multiply, and divide decimals to hundredths, using concrete models or drawings and strategies based on place value, properties of operations, and/or the relationship between addition and subtraction; relate the strategy to a written method and explain the reasoning used.

Sixth Grade CCSS.MATH.CONTENT.6.NS.B.3

Fluently add, subtract, multiply, and divide multi-digit decimals using the standard algorithm for each operation.

Sixth Grade CCSS.MATH.CONTENT.6.RP.A.3.c

Find a percent of a quantity as a rate per 100 (e.g., 30% of a quantity means 30/100 times the quantity); solve problems involving finding the whole, given a part and the percent.

IEP Goal Example:

By (month/year), when given simple percentage word problems student will solve for the answer by finding the percent of a number or by converting a fraction to a percent with at least 85% accuracy over 3 trials. Progress will be monitored using classroom-based assessments.

Objectives:

- Convert a fraction to a decimal
- Round off repeating decimals
- Convert a percent to a decimal
- Find a percent "of" a number
- Solve word problems by finding the percent "of" a number
- Convert a decimal to a percent
- Convert a fraction to a percent (Round decimals to nearest hundredth)
- Solve word problems by converting a fraction to a percent

Step-by-Step Math to Mastery™

Percent, Decimals, & Fractions

Overview and Suggestions for Use:

This lesson workbook addresses how to convert fractions to decimals, a percent to a decimal, a decimal to a percent, and a fraction to a percent. Students learn to find a percent of a number and solve simple word problems.

Percentages over 100% are introduced immediately with their corresponding mixed decimals and whole number equivalents. Students are taught what it means to have percentages more or less than 100% and how to check their answers to be sure they make sense.

In the final lesson (#11) there are problems that require long division with two-digit divisors. It may benefit some students to review how to round and estimate a quotient, as taught in the “Long Division with Two-Digit Divisors” workbook. If this is a stumbling block for your students, you might permit the use of calculators to divide since we are teaching and assessing how to convert between fractions, decimals & percent—not how to do long division. I would still require students to set up the division problem on the paper before entering it into the calculator. You may also find it helpful to point out that some of the fractions can be reduced/simplified which may make the division simpler as well.

Finally, at the end of the workbook you’ll find a page of common percentages that students would do well to memorize. You might choose to copy these onto flashcards, with the fraction on one side and the percent on the other side.

Math to Mastery Lesson Workbook

SAMPLE

Percent, Decimals & Fractions

SAMPLE
SAMPLE
SAMPLE
SAMPLE

Name _____

SAMPLE

I Can Find a Percent "Of" a Number

Model

In this lesson the multiplication symbol will be replaced by the word "of".

Instead of $30\% \times 50$, you will be asked, "What is 30% of 50?"

When we are asked to find a percent of another number, we multiply.

The steps are the same as in the last lesson:

Step 1: Change the percent to a decimal

Step 2: Multiply

Let's solve "What is 30% of 50?"

First, we write 30% as a decimal. 30% is how many hundredths?

30

I take off the percent sign and put in a decimal point moved over two places.

Next, we multiply.

There are 2 decimal places in the problem, so the answer needs 2 decimal places.

				3	0
×			5	0	
			0	0	
	+	1	5	0	0
		1	5	0	0

We end with the answer 15.

Say the statement, "30% of 50 is 15".

Does our answer make sense?

Yes. 30% is less than 100% so 15 is less than 50.

I Can Find a Percent "Of" a Number

Model

Let's do another one.

What is 130% of 50?

Step 1: Change the percent to a decimal. 130% is how many hundredths?

1.30

I take off the percent sign and put in a decimal point moved over two places.

Step 2: Multiply

There are 2 decimal places in the problem, so the answer needs 2 decimal places.

$$\begin{array}{r}
 \\
 1.30 \\
 \times 50 \\
 \hline
 000 \\
 + 6500 \\
 \hline
 65.00
 \end{array}$$

Say the statement, "130% of 50 is 65"

Does our answer make sense?

Yes. 130% is more than 100% so 65 is more than 50.

Read this problem: What is 3% of 50?

Step 1: Change the percent to a decimal. 3% is how many hundredths?

.03

Step 2: Multiply

$$\begin{array}{r}
 \\
 .03 \\
 \times 50 \\
 \hline
 00 \\
 + 150 \\
 \hline
 1.50
 \end{array}$$

Say the statement, "3% of 50 is 1.50".

Does our answer make sense?

Yes. 3% is less than 100% so 1.5 is less than 50.

I Can Find a Percent "Of" a Number

Guided Practice

What is 25% of 72?

Step 1:

$$\underline{\hspace{2cm}} \% = \underline{\hspace{2cm}}$$

Step 2:

Say the statement, "25% of 72 is _____".

Does your answer make sense? yes no

What is 125% of 72?

Step 1:

$$\underline{\hspace{2cm}} \% = \underline{\hspace{2cm}}$$

Step 2:

Say the statement, "125% of 72 is _____".

Does your answer make sense? yes no

I Can Find a Percent "Of" a Number

Independent Practice

What is 8% of 20?

Step 1:

_____ % = _____

Step 2:

×

+

Say the statement, "8% of 20 is _____".

Does your answer make sense? yes no

What is 180% of 20?

Step 1:

_____ % = _____

Step 2:

×

+

Say the statement, "180% of 20 is _____".

Does your answer make sense? yes no

I Can Find a Percent "Of" a Number

Independent Practice

What is 25% of 12?

Step 1:

$$\underline{\hspace{2cm}} \% = \underline{\hspace{2cm}}$$

Step 2:

Say the statement, "25% of 12 is _____".

Does your answer make sense? yes no

What is 50% of 12?

Step 1:

$$\underline{\hspace{2cm}} \% = \underline{\hspace{2cm}}$$

Step 2:

Say the statement, "50% of 12 is _____".

Does your answer make sense? yes no

I Can Find a Percent "Of" a Number

Independent Practice

What is 75% of 48?

Step 1:

$$\underline{\hspace{2cm}} \% = \underline{\hspace{2cm}}$$

Step 2:

Say the statement, "75% of 48 is _____".

Does your answer make sense? yes no

What is 5% of 48?

Step 1:

$$\underline{\hspace{2cm}} \% = \underline{\hspace{2cm}}$$

Step 2:

Say the statement, "5% of 48 is _____".

Does your answer make sense? yes no

I Can Solve Word Problems by Changing a Fraction to a Percent

Model

In this lesson you will solve word problems that ask you to find a percent.

Read this word problem:

Drew ran in 12 races. He won 6 of the races.
What percent of the races did he win?

The problem asks for a percent.
To find the percent, first you write a fraction.

Step 1: Let's read the problem again and write the fraction.

How many races did he run altogether? (12 races)

So I write 12 as the denominator.

$$\frac{\quad}{12} \rightarrow \text{altogether}$$

How many races did he win? (6 races)

I write 6 on the top.

$$\frac{6}{12} \text{ of the races}$$

Step 2: Now we change the fraction to a percent

$$\frac{6}{12} = 12 \overline{) 6.0} \quad \frac{.5}{\text{decimal}} = \frac{50}{\text{percent}} \%$$

What percent of the races did he win?

The answer is: He won 50% of his races.

I Can Solve Word Problems by Changing a Fraction to a Percent

Model

Let's do another one.

Read this word problem:

Luke's team won 6 out of 8 games. What percent of the games did Luke's team win?

Step 1: Write a fraction

How many games did they play altogether? (8 games)

So I write 8 as the denominator.

$\frac{\quad}{8}$ → altogether

How many games did they win? (6)

I write 6 on the top.

$\frac{6}{8}$ of the games

Step 2: Change the fraction to a percent

$$\frac{6}{8} = 8 \overline{) 6.00} \begin{array}{r} .75 \\ \underline{56} \\ 40 \\ \underline{40} \\ 0 \end{array} \quad \frac{.75}{\text{decimal}} = \frac{75}{\text{percent}} \%$$

What percent of the games did Luke's team win?

The answer is: They won 75% of their games.

I Can Solve Word Problems by Changing a Fraction to a Percent

Guided Practice

Step 1: Write a fraction

Step 2: Change the fraction to a percent

Rosie got 12 out of 15 problems correct on her test. What percent of the problems did she get correct?

_____ = $\frac{\quad}{\quad}$ _____ = _____ %

decimal percent

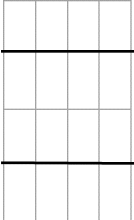

Rose got _____ of the problems correct.

Bill has 8 pens; 2 of his pens are red. What percent of his pens are red?

_____ = $\frac{\quad}{\quad}$ _____ = _____ %

decimal percent

_____ of Bill's pens are red.

I Can Solve Word Problems by Changing a Fraction to a Percent

Guided Practice

Step 1: Write a fraction

Step 2: Change the fraction to a percent

There are 14 students in after-school club. 7 of the students are girls. What percent of the students in the club are girls?

 $\frac{\quad}{\quad} =$

 $\frac{\quad}{\quad} = \frac{\quad}{\quad} \%$
 decimal = percent

_____ of the students in the club are girls.

Rachel recorded the weather for 10 days. 8 of those days were sunny. What percent of the days were sunny?

 $\frac{\quad}{\quad} =$
