

## Things you will need:

- filtered water •heart coffee
- v60 #02 •v60 filters #02
- burr grinder •water kettle
- coffee mug or decanter
- stir stick or small spoon •timer

1. Rinse paper filter with hot water.
2. Weigh out coffee to 22 grams.
3. Heat water to boil and wait for 45 sec  
(or as long as it takes to get the water to 203 Fahrenheit).
4. Grind coffee and add it into the V60. Settle it for an even coffee bed.
5. Pour 40-45 grams of water, stir vigorously with a spoon or stir stick.  
(This is to ensure all coffee is evenly saturated.)
6. Allow 30 seconds for a de-gas and then start pouring slowly into the center. Continue to pour into the center.
7. Pour should be slow and water line shouldn't go much above the coffee line. (This will prevent any water from escaping with out extracting coffee.)
8. When you've reached 360 grams of water, do one last stir to get the grounds off the side. Do not leave any coffee high and dry.
9. Pour should last between 2:20 and 2:30.  
Total contact time should be 2:40 to 3:00 (includes de-gas).

You may have to adjust your grind to find your desired extraction.
