

Steeda S550/S650 Mustang MagneRide Lowering Springs

Instructions for 555-8242

- A qualified technician should be used if you are not confident with removing and installing the vehicles front struts & springs.
- A suspension coil spring compressor must be used to allow for replacement of the mount and/or coil spring.
- **Caution:** Coil springs store a tremendous amount of energy. Failure to properly remove and install the springs can lead to severe injury.
- The vehicle will require an alignment following installation.
- Refer to a service manual for fastener torque specifications and make sure to torque suspension components at curb.

Front Spring Installation

1. Lift the car, by the chassis, on a vehicle lift or with a jack, and supported by jack stands, to work on the front suspension of the car.
2. Remove the front wheels.
3. Remove the ABS harness from the strut.
4. Disconnect the sway bar end link from the strut.
5. Remove the four bolts securing the brake caliper to the spindle and the spindle to the strut. See image 2.
6. Disconnect the MagneRide plug on the bottom of the strut.
7. From under the hood, remove the 3 nuts securing the strut to the strut tower. The strut can now be removed.
8. Using a coil spring compressor, compress the front spring until there is no tension on the upper strut mount. Once the spring is safely secured, remove the nut holding down the upper strut mount. Then, separate the strut from the spring and the upper strut mount. Carefully release the stock spring, and compress the new Steeda front spring. When putting the assembly back together, the larger diameter (ID/opening) of the spring should be upward and each pigtail should be against the spring stop. It doesn't matter which way the logos are facing. See picture 6-7 for more information. Replace the strut nut, and repeat the process for the other front strut.
9. It is very important to use Red loctite on the swaybar endlink studs and nuts mounting to the swaybar end. This will prevent them from coming loose.
10. Reinstall in reverse order.

Rear Spring Installation

11. Lift the car by the chassis, not the sub frame, and support with jack stands. The sub frame is going to need to be lowered, so the car needs to be supported by some other location.
12. Remove the rear wheels.
13. Disconnect the brake line bracket from the body and the MagneRide plug from the top of the shock.
14. Be sure the rear sub frame is supported by a jack, so that you can lower it independently of the car.
15. Remove the shock. There are two bolts securing it to the lower control arm, and two bolts securing it to the chassis on the top. **Once the shock is removed trim one ½" from the bottom of the OEM bump stop.**
16. Work on one side of the car at a time. Remove the 2 main bolts securing the sub frame to the car. There is a bracket on the front of the sub frame, that has 2 more bolts that will also have to be removed.
17. Once the sub frame bolts, and the shock are removed, lower the sub frame until the spring is able to be removed. The sway bar end link may need to be disconnected to gain the necessary drop.
18. Remove the stock spring. Reusing the upper rubber spring seat, install the Steeda spring with the tighter coils to the top, making sure the pigtails of the spring are in the correct locations. **NOTE: The rear springs are not the same. The spring with the part number ending in "RHWREAR" is to be used on the driver side and "LHWREAR" is to be used on the passenger side.**
19. Raise the sub frame back up, and install and tighten the sub frame bolts.
20. Replace the shock, at this time trim 1" off the factory rear bump stop, Pic 8.
21. Repeat the process on the other side.

Fronts

Correct, notice how the coil wraps 3/4 of the way around the upper spring seat.

Incorrect, notice how the coil only wraps 1/4 of the way around the upper spring seat.
