

# Deactivating Trigger Handlers

Documented by [Preeti Kumar](#)

## What is a trigger handler?

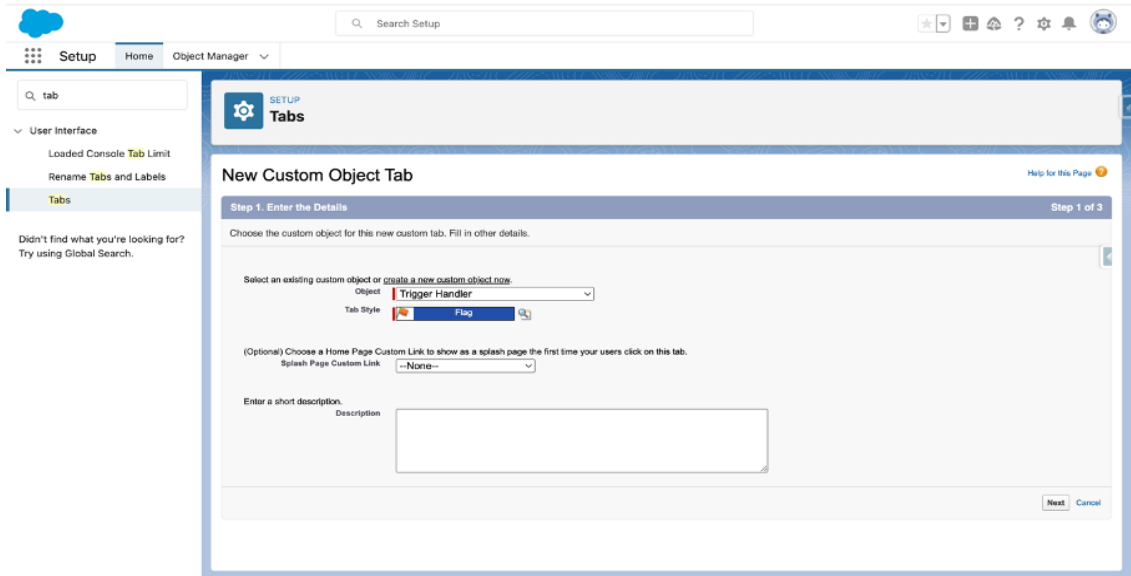

A trigger handler is an object responsible for managing the execution of trigger logic. Adhering to best practices for triggers involves the separation of reason from triggers into dedicated trigger handler components.

## When do we use a trigger handler?

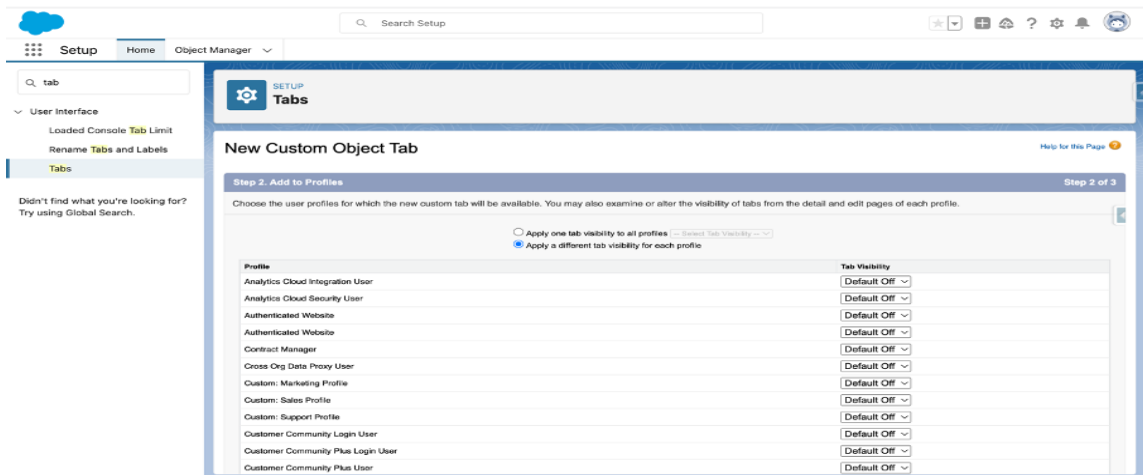

A trigger handler is a structural pattern that segregates the business logic of a trigger from the trigger itself. This handler comprises a distinct Apex class encompassing the code responsible for handling and executing the trigger event's logic.

## How to create a trigger handler tab

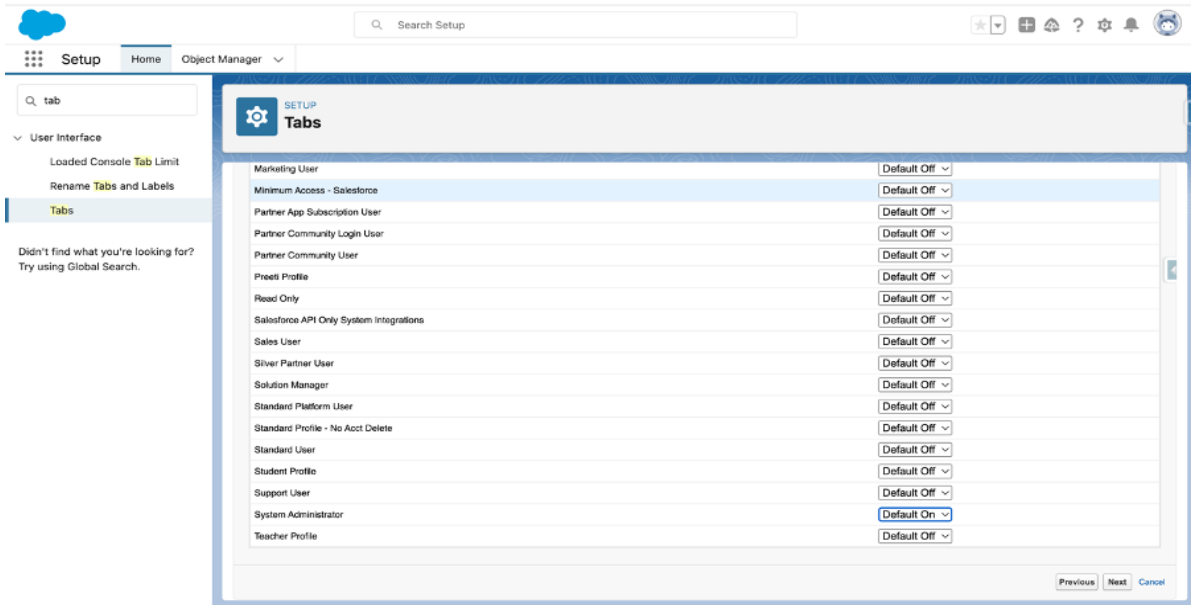

- Navigate to the setup menu
- In the quick search or finder, enter "Tab" as the search term
- Select Tabs
- Click the 'New' button
- Select the object to "Trigger Handler"
- Select your preferred tab style from the available options (any will do)

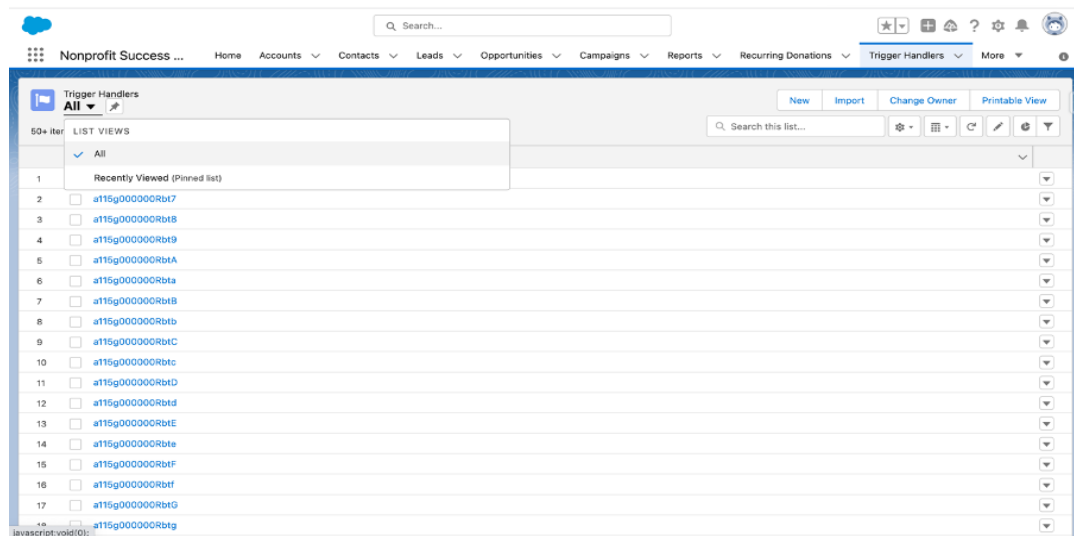

- First, check the radio button for 'Apply one tab visibility to all profiles' and select "Default Off"

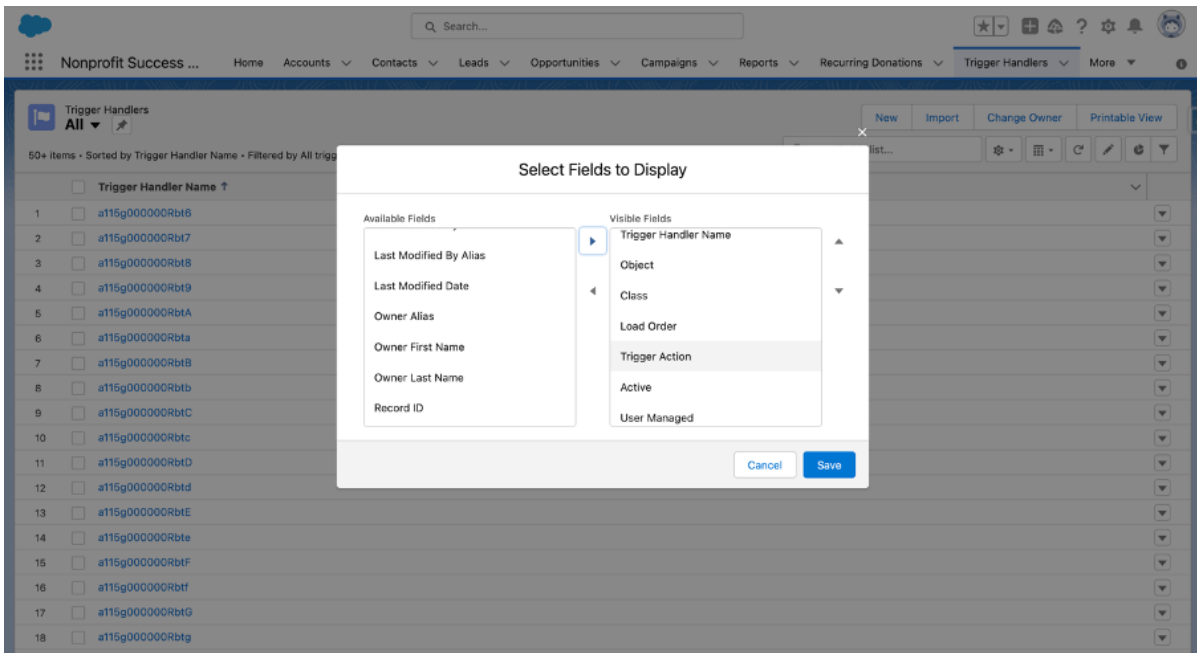

- Next, select the radio button instead for 'Apply a different tab visibility for each profile and change to "Default On" only for the System Administrator profile

- Using the App Launcher, navigate to the Trigger Handler object. On your List View, switch to All.

- Click on the gear icon situated below 'Change Owner' (List View Control), then choose 'Select Fields to Display,' and finally, select the fields you want to be visible

- Now you can observe all the fields that have been made visible under 'Select Fields to Display.'
